THE lighting load at Marylebone remains practically stationary, but the cooking and heating demand shows great development.—The Belfast City Electrical Engineer has been instructed to prepare a scheme on the lines laid down by Sir John Snell.—The transfer of the control of the tramway power supply at Sheffield to the Electric Supply Department has been effected. (Page 540.)

## ELECTRICAL ENGINEERS AND THE ARMY

THE London Electrical Engineers (Territorials) have now received permission to recruit. A further opportunity, therefore, occurs for members of the electrical profession to join a corps where their technical abilities will prove a valuable asset to their country. Application should be made personally or by letter to the Commanding Officer (46 Regency Street, Westminster, S.W.).

The following have received temporary Commissions as Lieutenants in the Royal Marines for duty with the Engineer Units of the Royal Naval Division:—R. G. Aston, L. H. Rugg, G. H. Spittle, A. J. D. Chivers, H. Dobell, R. Grierson, A. Williamson, T. C. Aveling, R. Stoltenhoff, G. W. Revell, G. E. Morgans. It will be remembered that these Units consist very largely of members of the Institutions of Civil, Electrical, and Mechanical Engineers.

**L. & S.W. Railway Electrification.**—The Directors of the London & South-Western Railway Co. have decided to issue new 5 per cent. preference bonds to the value of £1,000,000, terminable at the end of ten years, for the purpose of defraying the cost of the electrification scheme. The issue will be offered at 99½ per cent.

**Arrangements for the Week.**—(To-day) Thursday, October 8th. Greenock Electrical Society. Visit to Hunter Place Sub-station, 7.45 p.m.—Friday, October 9th. Electro-Harmonic Society. Smoking Concert, Holborn Restaurant, 8 p.m.—Monday, October 12th. Institution of Mechanical Engineers Graduates. "The Reclamation of Waste Products in Industrial Undertakings," by G. H. Ayres, 8 p.m.—Wednesday, October 14th. Association of Engineers-in-Charge, St. Bride's Institute, Fleet Street, E.C. "The British Empire and our Work in it," by Frank Bailey, 8 p.m.—Thursday, October 15th. Greenock Electrical Society 21 West Stewart Street. "Alternating Current," by J. H. Parker.

## ELECTRIFICATION OF L.B. & S.C. RAILWAY

### What is to be done about the German Contract?

IT will be remembered that a very large extension of the electrical equipment of the London Brighton & South Coast Railway is in progress. The present electrically-equipped lines are running so successfully that last year it was decided that all the suburban lines should be run electrically, involving the alteration of about 120 miles of line, the conversion of which it was estimated would take four years. The section of these from Balham through Streatham Common, Norbury, Thornton Heath, Selhurst, West Croydon, to Wallington, was taken in hand first, and it had been anticipated that this would be completed by the end of the present year. Passengers passing along this line will notice that the laying of cables and the building of sub-stations is proceeding, but apparently the rate of progress has been considerably reduced, possibly owing to the difficulty of obtaining the necessary skilled labour since the outbreak of the war; a large number of men employed on this class of work have always been Reserve men, and no doubt many others have volunteered for the Army. The cable, or, at any rate, a great part of it, is, we believe, of Belgian manufacture, but probably it had been possible to get this delivered before the declaration of war, as it was already in hand at the works of Ateliers de Construction de Charleroi at the time of the autumn meeting of the Iron and Steel Institute in Belgium last year. The cable is of a special design; although made in Belgium, it was made on British cable-making machinery, and the split-conductor system of mains protection is employed.

It is not, however, the cable work that is giving rise to a considerable amount of conjecture in electrical circles, but the equipment of the rolling stock. The order for this was given to the Metropolitan Carriage, Wagon & Finance Co., Ltd., and the equipment, i.e., the motors, controllers, &c., was sub-let to the Allgemeine Elektrizitäts Gesellschaft of Berlin. Nothing has been heard yet of arrangements having been made to transfer this important sub-contract to a British firm; and although it is apparent that the completion of the electrical equipment of the first section will take far longer than originally expected, yet we trust that the matter will not be allowed to drift until it is too late to take the contract out of German hands. In railway circles it is well known that the Metropolitan Carriage, Wagon & Finance Co. are extremely busy at present with ambulance trains and other material required by the railway companies, and possibly also by the War Office, so that it is reasonable to suppose that the construction of the trucks and bodies for the electric trains will have been put on one side for the present. In two or three months' time, however, there is little doubt that things will be more normal in railway carriage works, and one cannot but think that the Metropolitan Carriage Co. will then adopt the course of obtaining the sanction of the directors of the L.B. & S.C. Railway to order the electrical equipment elsewhere. Although these equipments are of a special character, yet we can state with assurance that there are British manufacturers (and also American and Swiss firms) who could fulfil the requirements absolutely, and supply material quite as good as the Allgemeine Elektrizitäts Gesellschaft of Berlin. The trains on the electrical section of the line now running were equipped by this Company to the fairly detailed specifications of the consulting electrical engineer to the Company; they have, it is true, worked very satisfactorily, but the leading British firms of electrical manufacturers could certainly construct equally efficient apparatus to the engineer's specifications.

Another reason for delay is that the permanent-way work, the alteration of bridges, &c., has proved to be

very considerable, and it seems quite probable that the date of the opening of the Balham to West Croydon and Wallington section will be towards the end of 1915 instead of this year. Notwithstanding this, however, we once more repeat our fervent hope that early steps will be taken to award the sub-contract for the electrical equipment of the trains to a British firm.

## GERMANY'S TELEGRAPHIC ISOLATION

ALTHOUGH it is known from the German Chancellor's messages to neutral countries how bitterly Germany resents our action in cutting her "cable," the public here do not quite realise the extent to which Germany is isolated telegraphically from nearly the whole world. It is not one cable that has been cut or interrupted, but eleven.

Germany has five submarine cables which land at Borkum; one goes to Brest, one to Vigo, one to Teneriffe, and two *via* the Azores to New York. All these have been cut since the war began. They all five pass through the English Channel, so that there has been no difficulty in cutting them, and it is impossible for Germany to restore them. Between Germany and England there are six cables, part owned by the German Government and part by the British Government; traffic on all these has, of course, been interrupted by us.

So much for possible outlets on the west coast of Germany. No outlets by the North Sea through other countries are possible. Through Holland, Denmark, Norway, and Sweden communication westward can only take place through cables landing in England and France, so that every message can be censored. To the south, Germany can reach the coast of Austria and Italy, but there again communication of German messages would be stopped, for the cables running from west to east in the Mediterranean are owned by an English company, the Eastern Telegraph Company, and land on British soil. The cables from Italy (and also Turkey) proceed *via* Malta, Gibraltar, and Lisbon, to the Atlantic, and the cable from Trieste through the Adriatic Sea, which is also owned by the Eastern Telegraph Company, touches first at Zante (Greece) and then at Malta. No communication to Africa is possible without using a cable belonging to the Eastern Telegraph Company, and Germany is also cut off from communicating with China by land-lines, as these pass through Russia or India. Except through her wireless service, therefore, Germany can only telegraph to her dupe and ally Austria, and to the neutral European countries. It is perhaps just possible that occasional messages may be got through the Atlantic cables with the help of third parties in neutral countries; but no code messages are accepted, and all messages suspected as coming from Germany would naturally be stopped. Her only chance in this direction would be the use of some sort of "plain language code."

The wireless telegraphic service, as we know, continues, but every electrical engineer realises that it continues only because it is to our interest to allow it to do so. The procedure known as "jamming" in technical slang could be resorted to without difficulty; a series of impulses of the same wave-length as that of the German stations, emitted by any of our own high-power wireless installations as soon as the German signals commence would effectively drown the latter, and German news, whether true or false, would then no longer be received at Tuckerton or Sayville in America. Those in authority evidently consider that this stoppage of the German wireless would not be worth while as the wireless stations in Germany's over-sea dependencies have now, we believe, all been destroyed. The one at Kamina (Togoland) was the first to go, and by now the Bethany station in German South-West Africa has probably shared the same fate.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,412.

A consumer, without notifying the supply authority, increases his load so that for one or two hours every day the load exceeds by 50 per cent. the rating of his meter. What will be the effect of such a procedure on the chief patterns of meter on the market, and what indication will the supply authority have that this has been done? It is of course assumed that the main fuses have not blown.

(Replies must be received not later than first post Thursday, October 15th.)

### ANSWERS TO No. 1,410.

Please explain fully why, with three single-phase transformers connected "star-star," it is impracticable to take any load between phases and neutral on the secondary side. What effect has the earthing of the neutral point of the primary windings on this?—"POWER."

The first award (10s.) is given to "J. E. R. R." for the following reply:—

The reason it is not practicable to take load from between one line and the neutral point of three single-phase transformers coupled in star is that the neutral point of the H.T. winding gets shifted, thereby causing abnormal voltages to be impressed on two of the H.T. windings. This can be seen clearly when the accompanying figure 1 is studied. Here are shown three single-phase transformers coupled in star. Suppose a load to be taken from the L.T. line A, and the neutral point N, then the current of this load will cause a load current to traverse the H.T. winding A.N. of nearly the same ampere turns as the secondary current. This primary current will have to be

Fig. 1.

Fig. 2.

partly supplied through BN and partly through CN. Now as there are no corresponding amperes in the L.T. windings of BN and CN, they act as choking coils for the current supplied to AN, and consequently the voltage across their terminals may rise to an abnormal value, whilst that across AN will fall. The neutral point will therefore be completely shifted, upsetting the symmetry of the whole system.

Take the case when a similar load is drawn from one line and the neutral point of a three-phase transformer. Here all three magnetic circuits are interlinked by the cross core pieces, and all the flux going up one limb must pass via the butt pieces and down either of the other two limbs, so that the sum of the fluxes is zero. Consequently when the magnetic condition of one limb is altered there must be a corresponding alteration in that of the other two limbs, so that the neutral

point is approximately fixed. Taking load from one line and the neutral point in such a transformer does not lead to anything like the disturbance as in the case of three single-phase transformers. Slightly different voltages may be encountered, but providing the iron in the three limbs is of fairly equal permeability, the differences are not great. There is, however, a leakage field set up in the spaces between the coils of the loaded and unloaded windings which makes the regulation poor.

The remedy suggested, to earth the primary neutral point, which of course assumes the generator neutral to be earthed, may help to a certain extent, but it has one objection. The generator will keep up the voltage on all three phases of the primary, and thus fix the neutral point, but in all probability there will be a third harmonic present in the system which will cause heavy triple frequency currents to pass through the earth between the two neutrals. These may have very harmful effects on neighbouring telephone systems.

A better remedy is one adopted by the Westinghouse Co., which is to split up each of the three L.T. windings into halves and interconnect them as shown in Fig. 2. It will be seen that the demagnetising E.M.F.'s in the two halves of each winding are opposed, and thus when the load current is drawn as suggested two of the H.T. windings are affected equally, which makes the neutral point quite stable. A load may then be taken from any low tension line, and the neutral point, whether the primary neutral is earthed or not.

This method of interconnecting the L.T. windings also gives good results when applied to the windings of a shell type three-phase transformer.

The second award (5s.) is given to "ELECTRON," who writes as follows:—

Especially in colliery work it is often desired to take a lighting supply from one phase of a three-phase system, but this is impracticable when the pressure is stepped down by means of a star-star connected transformed with unearthed neutral points, for the following reason:—The load of lamps or of motors draws current from phase OC of the secondary only,

Fig. 3.

and in no way affects phases AO and BO (Fig. 3). But on the primary side the current in phase OC must return to the power-house, and, as there is no neutral connection, has necessarily to traverse either or both of phases AO and BO on the primary. This current passing through the two other phases naturally magnetises them, and the result is to influence the corresponding phases on the secondary. As no current is drawn from the secondary side of these two phases, the whole of the current flowing in the primaries must be a magnetising current, and the result is, therefore, a tendency for the secondary voltage on these two phases to rise. The actual neutral point, therefore, moves along from O towards C, and the voltage of phase OC drops away rapidly. Summing up, the effect of a load on one phase of a star-star connected transformer with a four-wire secondary is to short-circuit that phase and reduce its voltage practically to zero.

Earthing the star point on the primary side has no effect whatever upon the situation unless the star point of the secondary is also earthed. With this done, the trouble is entirely eliminated, but only at the expense of introducing further difficulties. As is generally the case, the star point of the generator will be earthed, and, as is well known, it is not permissible in a majority of cases also to earth the star point of the primary side of a transformer connected to such a generator. The third harmonic present in a voltage wave of the primary current of every transformer will raise the neutral point of the transformer to a potential above ground, depending upon the strength of the harmonic. A circulating current will then, as is well known, flow along the circuit composed of the transformer earth connection, earth, earth connection of the generator and along the line wires back to the transformer. These third harmonic currents may be of considerable dimensions, and for this reason it is undesirable to earth the primary neutral point of the transformer.

**Live Wire Defences.**—The use of live high potential wires with success for repulsing attack is again reported in Belgium on the river Nethe, between Duffel and Lierre, about eight miles south of Antwerp, where a force of Germans are stated to have been held up by "electrified wire entanglements," and "absolutely shattered."

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published October 1st, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

20,821/13. **Mercury Vapour Apparatus.** E. E. DARMOIS and M. A. E. LEBLANC (Paris). An electrical heater is provided to facilitate starting, and a thermal contact prevents the main E.M.F. from being connected to the electrodes when the temperature is unsuitable. Five figures.

22,420/13. **Power Factor Regulation.** B. T.-H. Co. (*G. E. Co., U.S.A.*). Improvements in automatic regulators for the excitation of synchronous machines employed for power factor improvement. The regulator employed contains a floating contact, the position of which is varied according to the power factor. The contact is controlled by opposing potential windings, each connected across a side of the system, and a current winding associated with each potential winding connected in series with a phase of the system. One figure.

29,239/13. **Distant Control.** E. H. and K. A. WIDEGREN (Sweden). An arrangement for reducing the effect of line capacity in actuating electrical apparatus at a distance by means of pulsations from a continuous current source with a commutator rotating constantly or step by step with sliding brushes and connected with the continuous-current source in such a way that the bars are connected two and two alternately with the positive and negative side, and arranged so that the preceding bar of each pair transmits a current with lower potential than does the following one. Four figures.

4,677/14. **Shades.** HOLOPHANE, LTD. and O. A. MYGATT. Composite reflectors, consisting of prismatic glass reflectors with smooth metal covers spun over them. Four figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Batteries:** PRESTON [Primary batteries] 19,854/13.

**Ignition:** HORSTMANN [Automatically adjustable ignition] 21,607/13.

**Switchgear, Fittings, &c.**—BACON & REDPATH [Controllers for gun-training motors] 20,719/13; DOBSON [Lamp holders] 20,725/13; LEONARDT [Plugs and sockets] 22,926/13; MCCLELLAND [Shade-holder] 26,657/13.

**Traction:** BLACKBURN [Automatic locking devices for carriage doors] 21,516/13; BOWKER & JONES [Simultaneous carriage door locking] 21,895/13; DAMMOND [Track circuits] 9,611/14; ESTLER [Conductor rail insulators] 11,343/14.

**Miscellaneous:** AIKMAN [Electric torch] 20,990/13; GRATZE [Electric horns] 28,059/13; BIGGE and BUTT [Mercury breaks] 441/14; PARKS [Water level indicator] 17,835/14.

### THE REDUCED LIGHTING OF LONDON

THE following are the latest regulations issued regarding the reductions in lighting which are being made in London in connection with the Aerial Defence scheme:—

In all brightly lighted streets and squares and on bridges a portion of the lights must be extinguished so as to break up all conspicuous groups or rows of lights; and the lights which are not so extinguished must be lowered or made invisible from above by shading them or by painting over the tops and upper portions of the globes; provided that while thick fog prevails the normal lighting of the streets may be resumed. Sky signs, illuminated facias, illuminated lettering, and powerful lights of all descriptions used for outside advertising or for the illumination of shop fronts, must be extinguished. The intensity of the inside lighting of shop fronts must be reduced. In tall buildings which are illuminated at night the greater part of the windows must be shrouded, but lights of moderate brightness may be left uncovered at irregular intervals. All large lighted roof areas must be covered over or the lighting intensity reduced to a minimum. Lights along the water front must be masked to prevent as far as practicable the reflection of the light upon the water. The aggregation of flares in street markets or elsewhere is prohibited. In case of a sudden emergency all instructions given by the Admiralty or by the Commissioner of Police on the advice of the Admiralty, as to the further reduction or extinction of lights, shall be immediately obeyed.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Miscellaneous:** VON TAGUEEFF [Ozonisers] 27,258/13; GRUNER [Ozonisers] 18,025/14; LINDSAY [Electric primers] 18,810/14; HAMMOND [Teledynamic control] 19,013/14; A. E. G. [Internal combustion engine with electrically driven charging pump] 19,492/14.

### Amendment Allowed

9,945 and 27,340/13. **Illuminated Signs.** C. L. GRUGEON. Leave has been granted to amend those specifications by the addition of the name of M. E. Grugeon.

### Opposition to Grant of Patents

Opposition has been entered to the grant of a Patent in the following specification:—

8,975/14. **Signalling in Mines.** J. J. ADLINGTON. A system in which the signal is automatically recorded on a paper drum and also remains visually indicated on a dial, actuated by an electromagnet step by step arrangement, until the next signal is made.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

18,284/00. **Transformers.** A. F. BERRY and BRITISH ELECTRIC TRANSFORMER Co. This is for improvements in construction of the Berry transformer, especially in connection with the use of cores composed of several sector-shaped assemblages of sheets of different widths.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** T. SHEPHERD [Spring cable couplings] 13,358/03; N. LEBEDENKO [Cable sockets] 30,491/09.

**Dynamos, Motors and Transformers:** H. A. MAVOR and MAVOR & COULSON ["Spinner" motor] 13,724/07.

**Electrochemistry and Electrometallurgy:** S. Z. DE FERRANTI [Furnaces for nitrogen fixation] 13,965/06.

**Incandescent Lamps:** P. M. JUSTICE (*Deutsche Gasglühlicht A.G.*) [Straightening filaments by loaded hook] 13,956/06:—This is not the famous "weighting" patent 8,563/07.

**Telephony and Telegraphy:** J. A. FLEMING [Wavemeters] 13,736/04.

**Traction:** A. J. and A. C. BOUNEVILLE [Cab signalling] 13,932/02; W. FAIRWEATHER (*Brown Hoisting Machinery Co., U.S.A.*) [Overhead mono-rail locomotives] 13,427 & 8/04; A. H. BRYNOR and R. P. BROUSSON [Signals] 13,709/04; M. RATHBONE, H. FIELDING and A. P. LATHAM [Automatic points] 13,760/07.

**Miscellaneous:** F. W. HOWORTH (*Magneta Fabrik Elektrischer Uhren, Zurich*) [Electric clocks] 13,686/04; G. H. and H. H. HOOPER [Electric clocks] 12,987/08; W. E. LAKE (*Fabrik Elektrische Zünder Ges.*) [Shot-firing magnetos] 14,126/09.

**Overhead Wiring Fatality.**—We have our attention called to a cutting from a Canadian paper, which illustrates some of the dangers of the great complexity of overhead wiring in some American and Canadian cities. After an inquest into the death of a storekeeper, the jury returned a verdict that the deceased "Came to his death by electrocution caused by the Cataract Co.'s arc service wires coming in contact with the G.N.W. telegraph wires and then in contact with the Cataract Co.'s service wires and the said telegraph wires, thereby conveying extra high voltage into the house services, caused by the leaning of the cataract power pole and the general carelessness of the Cataract Power Co. . . . we . . . strongly condemn the general condition of the street wires in the city."

**University Announcements.**—The Goldsmid Entrance Scholarship, University College, University of London, tenable in the Faculty of Engineering, of the value of £90, has been awarded to Mr. John Sinclair Fraser, of Dulwich College. Mr. Patrick Alexander Curlett was placed *proxime accessit*.

The Calendar of Armstrong College, Newcastle-upon-Tyne, for the session 1914-15, contains full information as to the college, which is part of the University of Durham, and the courses carried on in its various departments. The Electrical Engineering section is under Prof. W. M. Thornton, and Mr. W. W. Frith also lectures on this subject. Students can qualify for the B.Sc. degree in Electrical Engineering by taking the full three years' course. Evening and Saturday classes are also held, and there are special courses in mining subjects.

## L.C.C. AND LOAN PERIODS

## Dispute with St. Pancras Borough Council

SOME interesting correspondence has taken place between the St. Pancras Borough Council and the London County Council with regard to the reduction of the period of repayment of early loans for the electricity undertaking. In the early days of electric supply in London an all-round period of forty-two years was allowed in respect of loans for the various undertakings belonging to the Borough Councils, but since then considerable modifications have been made in the periods. The following table is interesting as showing the variation in the periods up to the year ended July 30th, 1912:—

Purpose.	Periods in force to Nov. 27th, 1906.	Revised	
		Periods from Nov. 27th, 1906, to July 30th, 1912.	Periods from July 30th, 1912.
	Years.	Years.	Years.
Land ... ..	60	60	60
Buildings ... ..	42	50	30
Mains ... ..	42	30	25
Plant and Machinery	42	20	15
House Services ...	42	12	12
Meters ... ..	10	10	10

The dispute between the two authorities has arisen in connection with recent applications for sanction to loans of £15,000 for the Ljungstrom turbine, and £26,788, the estimated cost of extensions at the King's Road Station. The L.C.C. asked the Borough Council to reduce the period for the existing loans before the loans for the new plant were sanctioned. The period for repayment of existing plant is in most cases forty-two years, and the suggestion is made by the County Council that the outstanding period should be reduced by half, or to fifteen years from the present time, whichever is the shorter period.

In a report upon this matter the Borough Treasurer and Accountant points out that the amount outstanding on the old plant will be £108,481 on March 31st, 1915. The annual charge on the present basis for principle and interest is £6,328, whereas on the new basis of half the unexpired period this would be increased to £10,443, thus showing an increased charge to revenue of £4,115. The point of the County Council is that the new plant for which loans are now being asked will supersede much of the existing plant, but that point of view is not taken by the Borough Council on the ground that the bulk of the existing plant will have to be maintained in an efficient condition as a standby. It is further pointed out that some of the loans have been obtained from other sources than the County Council, and that there would be difficulty in rearranging the terms.

Mr. Sydney Baynes, the Borough Electrical Engineer, reporting upon the proposal, points out the unfairness, in view of the costly nature of early pioneer plant, of reducing the periods for repayment of loans, and also reminds the County Council that the long period loans were granted to pioneer undertakings like St. Pancras in order to encourage the development of a new, and what at that time might be termed an experimental venture. No objection is taken, of course, to the shorter period with regard to present-day loans, nor to the policy of writing off the amounts of unpaid balances on machinery actually displaced by newer plant. This is actually being done at St. Pancras.

In view of these reports the Electricity Committee recommends that the proposition of the London County Council be not entertained, and that two representatives of the Electricity Committee and two of the Finance Committee be appointed to interview the London County Council Loans Committee. It may be mentioned that the Council has sanctioned the £15,000 for the Ljungstrom turbine, but has not so far sanctioned the other sum for the extensions at King's Road. A point to be remembered is that the Borough Council cannot be compelled to reduce the period for the earlier loans, and the object of the proposed conference is to discuss any difficulties which may be put in the way of sanction to the second sum of £26,788 for extensions at King's Road.

**Western Section of the I.E.E.**—At a committee meeting of the Western Section of the Institution of Electrical Engineers, held on Thursday, September 24th, it was unanimously decided that no meetings of the section should be held at present, as it was felt that owing to the war and the resultant unsettled state, the attendance at the meetings would be small.

TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)

An article on page 534 deals with the telegraphic isolation of Germany, and also refers to the wireless signals which we still allow to be sent out. These are probably being sent by the large power station at Hanover or else from Nauen, near Berlin. Both have sufficient power to transmit to America. Another form of wireless station, however, is being rigorously suppressed, namely, the small stations in the United Kingdom, the owners of which have not obeyed the order to dismantle. A flagrant case in point was heard at the West London Police Court last Thursday. The culprit was a nineteen-year-old clerk named Watsdorf, who lived with his grandfather, a German. He had originally erected his wireless station in 1912, and, on being communicated with, he had applied for a licence which had been refused, and he had been requested to dismantle the station. On August 5th this year, however, it was discovered that he had a wireless plant in use, using a pole on the roof as an aerial and employing current from the Hammersmith electric light mains for transmitting purposes. From May 7th to September 13th last he had used 31 units of electrical energy for working the apparatus. Although of amateur make the apparatus was of a nature to work efficiently, to receive any powerful messages of English, French, or German origin, and to transmit about 100 miles by daylight or 150 miles at night. The aerial was dismantled by Post Office workmen, but it appeared from the evidence that the Post Office had suspected the prisoner of having used the apparatus subsequently. The prisoner was remanded on bail (£100).

There is no doubt that useful information is still being sent from this country to Germany, and the Post Office is wise in insisting on the suppression of all private wireless and in applying for the severe punishment of all owners of them who have not complied with the order to dismantle them. This order has been so widely discussed that no one can plead ignorance of it. Although no single station of sufficient power could be transmitting to Germany direct without having been detected, yet it is just possible (although perhaps not probable) that by means of a chain of small power stations with hidden aerials messages may be transmitted a few miles at a time, and thus get across the North Sea or the Channel. A comparatively small station with an aerial hidden in the roof of a house or carefully trained up a flagstaff floating the Union Jack, could transmit 100 miles. Such stations could also easily receive signals sent out by our own wireless stations, and also receive instructions transmitted from German wireless stations.

In our issue of September 8th we expressed the hope in these columns that the Government was not overlooking the necessity of laying additional cables in the English Channel, and we now learn that several new cables have been laid. It would not be advisable to give any indication of the position of these, and it must be sufficient to state that they are ample to maintain full communication with the Continent in any contingency. Moreover, the cable huts at the English and Continental ends of all Channel cables are well guarded against surprise attacks; and there have been no cases of any of our cables having been disturbed.

Mr. G. Marconi, says a Reuter telegram from Rome, has just completed a tour of inspection of all the wireless telegraph stations in Italy. He reports having found them in a state of perfect efficiency for any war emergency.

In connection with the transfer of the Post Office telephone system in Hull to the Corporation, it is stated that 184 of the old Post Office staff have agreed to transfer to the Corporation, whilst eighty-six have applied to the Post Office for transfer to other P.O. services.

The French Co.'s Cable between Paramaribo and Cayenne failed on September 29th, messages for French Guiana having to be directed "via Salinas."—The French Administration announced that Togo may again be communicated with via Cotonou-Lome at the same rates as before.—Deferred service was again permitted on the Eastern and Western cables as from the 1st inst., although power is reserved to suspend it again should cables be choked with traffic.—Telegrams to New Caledonia during the interruption of the cable may be sent by wireless via Brisbane.—The Italian Administration refuses to entertain applications for refund.—The Almeria-Melilla cable is interrupted, and that between Penongomera-Alhucemas is faulty, and telegrams for Melilla, Nador, Zeluán, Chafarinas, and Cabodeagua are being sent by boat from Malaga.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### TRADING WITH THE ENEMY

**A**LTHOUGH the Proclamation with regard to "Trading with the Enemy," published in our issue of September 17th, states that enemy character does not attach to limited companies incorporated in Great Britain or in friendly countries, yet it must not be assumed, as we fear has been done in some cases, that absolute freedom is granted as to trading with English branches of German firms, even if these branches be registered as limited companies here. We make no apology for returning to this matter, for the proclamation is not drafted as clearly as it might be, and several conflicting interpretations have been given to it. It is made clear, however, in the main clause of the proclamation that persons may not directly or indirectly supply to or obtain from an enemy country any goods, wares, or merchandise. Although in the strict legal interpretation of the words of the proclamation, therefore, an English limited company established here to sell German goods may not have "enemy character," yet it is obvious that anyone placing orders with them would run the risk of buying goods obtained from Germany indirectly through a neutral country. This would distinctly be a penal offence under the terms of the proclamation, and heavy penalties might be incurred. The same applies in the case of selling to such an Anglo-German firm if there is reason to suppose that the goods are "directly or indirectly" destined for Germany or Austria, or "for the use or benefit of an enemy." It is safest, therefore, as well as being a patriotic duty, to refrain from dealing with such firms, and to buy only goods from British manufacturers or their accredited agents.

Many of our readers may have doubts as to the position of firms with whom they may contemplate doing business, so far as foreign share capital and foreign control is concerned, and inquiry is sometimes both difficult and delicate. To assist our readers in this connection we have made arrangements with the British Traders' Association (Balfour House, Finsbury Pavement, E.C.) to give confidential information on such matters in response to *bona fide* inquiries, and to charge only a nominal fee (2s. 6d. for inquiries as to Limited Companies and 1s. for inquiries as to private firms or individuals). Readers desiring to make use of this service should clearly explain for what purpose the information is required, and it is to be understood that both the requests for information and the replies are considered confidential.

**A Useful Adjunct to the Telephone Directory.**—A book that should be of considerable utility has been published by Messrs. Stone & Colquhoun (92 Victoria Street, S.W.) in the form of a "Key to the London Directory," which provides a means for ascertaining the name and address of a subscriber in the London area whose exchange and number only are known. Each number has opposite it a reference to the page on the ordinary directory on which it may be found, so that by not repeating the whole of the entries, the work can be kept within moderate compass.

**Coal Traffic.**—A very attractive booklet, entitled, "The Magnet of Commerce," issued by the Great Central Railway, gives a quantity of interesting information about the Midland, Lancashire, and North Wales coal fields, the preparation and distribution of coal, and its export. In this connection the company's new dock at Immingham is described. An excellent map is included, and there is much general information about the handling of coal in that part of the country served by the railway.

### NEW INSPECTION BOXES

**W**E illustrate here new patterns of outlet cover inspection bends and tees which have just been put on the market by Simplex Conduits, Ltd. (Garrison Lane, Birmingham).

SIMPLEX OUTLET COVER INSPECTION TEE AND BEND.

These provide an easy means of branching off from the main run of conduit to a light point and switch, and effect a considerable saving in labour and material, while making the neatest junction possible.

### ROYAL EDISWAN LAMPS

**A**VIGOROUS "All-British" campaign is being conducted by the Edison & Swan United Electric Light Co., Ltd., and a very effective full-page advertisement appeared in the *Daily Mail* last week emphasising in a happy way the British origin of Royal Ediswan lamps. Another new publicity venture of the Company is a neat little periodical entitled "Ediswan Electric Service," the first issue of which has just been produced. This forms an illustrated record of the progress of the manufacture of Ediswan electrical goods. Several of the latest artistic designs of fittings are illustrated, and there are articles dealing with a new reading lamp and the use of Ediswan fans, electric irons and other accessories in the household. The little periodical is attractively produced and has our best wishes.

### SCHAFER & BUDENBERG'S NEW WORKS

**T**HIS firm, established in Manchester in 1850, and of which Mr. Budenberg, who was born in Manchester, is the principal, have just removed to their new works at Broadheath, near Manchester. The new building, in which the firm's well-known steam pressure gauges and other specialities are manufactured, covers an area of 3,728 sq. yds., and is surrounded by land which has been acquired for further extension of the works when necessary. The building is of red brick, and consists of three floors. The south roofs of the building are of asbestos (slate pattern), through which the heat does not penetrate, while the north roofs are glazed, thus giving an excellent diffused light throughout the workshops and offices. The shops are electrically driven, the British Westinghouse Co. having been responsible for the installation.

In addition to their regular lines of high and low pressure gauges, the firm manufacture electric alarm gauges, gauges with adjustable contacts for switching compressor pumps, &c., on and off, continuous self-recording pressure gauges, tachometers, valves, &c. In these new works the various processes are to be seen in operation in connection with the making of clock movements, &c. Each gauge is marked under actual pressure compared with the test gauge, while the test gauge is compared at intervals with the open mercury column gauge specially erected in the building for this purpose. The very important process of dial marking is carried out in the printing and lithographic department adjoining the testing room. In other parts of the building the offices, laboratory, photographic departments, stock rooms with steel racks fitted for heavy goods, store and packing rooms, all having fireproof doors, are well arranged for the carrying on of the extended business which the firm's removal to Broadheath has necessitated. A precautionary measure against fire is the storage room for boxes, wood-wool, and other inflammable material, which is separated from the main building by a brick wall.

That they are British made is not their only virtue—they are unsurpassed for Economy, Brilliancy and Durability too.

*Recommend Mazdas and ensure satisfaction.*

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, 77, Upper Thames St., E.C. Branches in all large Towns.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**London: St. Pancras.**—In order to provide as much work as possible during the winter, the Electricity Committee recommends an overhaul of the cable system in order to abolish the old Henley distribution system. The renewals at present amount to from £1,500 to £2,000 per annum. It is now proposed to lay a new 0.8 sq. in. feeder and generally rearrange the cables at a cost of £4,650. It is also proposed to lay a 0.15 sq. in. three-core H.T. conductor between the two generating stations at a cost of £1,050 plus £200 for labour. The ducts were provided some years ago.

**Maidstone.**—Application has been made for sanction to a loan of £2,800 for new boilers.

**Tunbridge Wells.**—Twelve months' supply of high- and low-tension cable. Borough Electrical Engineer. November 7th. (See advertisement on another page.)

**Warrington.**—Sub-station ironclad switchgear. Borough Electrical Engineer. October 13th.

#### Wiring

**Birmingham.**—Electrical installation at Western Road House and Dudley Road Infirmary. Clerk to Guardians, Edmund Street. October 26th.

**Wirral.**—An expenditure of £700 is contemplated upon the electric lighting of the joint hospital.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdare.**—Hospital (£11,500).

**Belfast.**—Electric lighting of the operating theatre and wards at the infirmary. Consulting Engineers, Young and Mackenzie. Tenders to Clerk. October 13th.

**Blackburn.**—Reconstruction of Parkside Mill, Walter Street.

**Coventry.**—Technical school, Pool Meadow.

**Dewsbury.**—A consulting engineer is to report as to the electric lighting of the Guardians' premises.

**Hayward's Heath.**—New Post Office.

**London.**—160 wiring points at the Woolmore Street School, Poplar. Clerk, October 28th. (See advertisement on another page.)

**Mayo.**—Electric lighting of Castlebar Asylum (£3,000).

**Neath.**—Isolation hospital (£14,000).

**Northwich.**—School in Priory Street.

**Rhondda.**—Electric lighting and fittings at the electricity and destructor works, Appletree, Porth. Consulting Engineers, R. Hammond & Son, 64 Victoria Street, S.W. October 17th.

**Swansea.**—500 houses, Town Hill. Town Hall.

#### Miscellaneous

**Leeds.**—A loan of £32,000 is to be taken up for tramway extensions.

**London: L.C.C.**—Construction of tramway on overhead system from Lee Green to Eltham. Chief Engineer. October 13th.

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Bolton.**—A contract has been entered into with the Chloride Electrical Storage Co. for the maintenance of the storage battery.

**Manchester.**—A contract has been placed with the Liverpool Electric Cable Co. for cable.

**Rochester.**—The Kent Electric Power Co. has placed an order for seventy-three time switches for Rochester, with Vanner Time Switches, Ltd.

**Winchester.**—A contract for 105 time switches has been placed with Vanner Time Switches, Ltd.

**York.**—The tender of Edison Accumulators, Ltd., has been accepted for the supply of four electric omnibuses at £1,172 each.

### LOCAL NOTES

**Brighton: Supply to Railway Co.**—An amendment to the new agreement with the London, Brighton & South Coast Railway Co. has for its object the inclusion of the yards in the term "workshop." Some objection was taken to this by several members of the Council on the ground that it would enable the Railway Co. to light its goods yards at the power rate, but Mr. J. Christie, the Borough Electrical Engineer, has no objection to the amendment as it is only intended to apply to the yards attached to the workshops, and not to the goods yards, sidings, and stations.

**Belfast: Proposed New Power Station.**—Mr. T. W. Bloxam, the City Electrical Engineer, has been instructed by the Tramways and Electricity Committee to prepare a complete scheme for extensions of the electricity undertaking, in conformity with the recommendations of Sir John Snell and Mr. W. J. Pratten, set out on page 527 of our last issue.

**Edinburgh: Emergency Work.**—The Electrical Engineer is to report upon works which might be undertaken immediately with a view to providing employment during the winter.

**London: Hackney: Motor-Converter Contract.**—The Electricity Committee has agreed to the release of the cash deposit of £800 made by Messrs. Bruce, Peebles & Co. in connection with the contract for six motor-converters for the sub-stations. An ordinary bond is to be entered into instead. The reason for asking this concession is the stringent monetary conditions existing at present owing to the war. At the same time, it should be pointed out that two of the six machines have been erected, two are in course of erection, and the remaining two were ready three months ago, but the Council was unable to take delivery. They are now in the hands of the Council.

**St. Marylebone: Heating and Cooking Prospects.**—The accounts of the Electricity Department for the June quarter show that whilst there is an increase of 7.84 per cent. in output over the abnormal June of last year, the lighting business is practically stationary. Mr. A. H. Seabrook points out in his report that although there is still a large field in the Borough for electric lighting, most of the possible consumers are those who have been secured by free wiring (piping), hire-purchase, and hire schemes. Although the Electricity Department does a fair amount of business by these methods, in order to increase it it will be necessary to put before consumers still more attractive methods of obtaining the installation, and these methods, in Mr. Seabrook's opinion, must consist in relaxing guarantees and spending considerable sums in free wiring, the cost being recovered by weekly or monthly payments. There is no

question, he adds, that the Department can make as great a success of this class of business as their competitors, and further schemes will be submitted to the Committee as time goes on. Whilst, however, the field for electric heating and cooking remains so promising, it is thought the best policy to concentrate efforts on securing this load.

**Sheffield: Transfer of Duties.**—The scheme by which the electric supply to the Tramways Committee will come under the direct control of Mr. S. E. Fedden and Mr. H. E. Yerbury, at present Electrical Engineer to the Tramways Department, as Assistant Manager of the Electric Supply Department, formally came into force last week. We gave details of the scheme in our issue for September 17th, p. 504.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, the following may be taken as the official quotation for electrolytic copper bars, viz., £54 10s. to £55. (Last week, £57 to £57 10s.)

**Change of Telephone Number.**—The telephone number of the Liverpool Branch of Simplex Conduits, Ltd., has been changed to Royal 4726 and 4727.

**Change of Style.**—The name of the firm hitherto known as Haslam & Schonheil, Ltd. (11 Windsor Place, Cardiff), has been changed to Haslam & Stretton, Ltd.

**Cryselco, Ltd.**—Mr. T. J. Grainger, who was Manager of the late Sunbeam Lamp Co., Ltd., has now joined Cryselco, Ltd., of Kempston Works, Bedford, as Sales Manager. His offices will be at 21 Moseley Street, Newcastle-on-Tyne. Telephone, Central 3474. Telegrams, "Cryselco, Newcastle-on-Tyne."

**Venner Time Switches.**—The Board of Trade approval has been given to Venner Time Switch Type "RB."

### APPOINTMENTS AND PERSONAL NOTES

A Clerk of Works is required for the Ilkley electricity undertaking. Applications to Town Clerk.

## SUMMARY

THE electrical equipment of a large motor-car works is described in an illustrated article. (Page 542.)

THE "Museum" telephone exchange in London is described on page 543.

THE testing of transformer ratios is dealt with in our "Questions and Answers" columns. (Page 544.)

AN "unlicensed wireless" case is referred to under Telephony and Telegraphy. (Page 545.)

THE L.C.C. on Tuesday decided, without discussion, to proceed with its electric power scheme. (Page 545.)

SOME important lawsuits are on the list for hearing between now and Christmas. They include an application for a compulsory licence under the drawn-wire metal filament lamp patents, three actions for alleged infringement of the Osram patents (by the Pope, Gabriel, and Corona lamps respectively), an appeal against the injunction against the Long Eaton Urban District Council for using a differential system of charging, and an appeal by Messrs. Kirkland & Capper in the famous War Office case. (Page 545.)

SOME patent specifications relating to lamp-holders, plugs, and shade-carriers were published last week. Application is being made for the suspension of the Thermit rail welding patents. A patent of the B.T.-H. Co. relating to remote control circuit breakers expires this week after a full life of fourteen years. (Page 546.)

A NEW form of protection of flexible wires is described in our Trade Section. (Page 547.)

GENERATORS and switchgear for electric vehicle charging are required at Sydney; cable, conduit, and distribution pillars at Blackpool; meters at Gisborne (N.Z.); a 5,000-kw. turbo-alternator at Salford; new generating plant and cable at West Bromwich and Walsall.—A large quantity of lamps is required by the South African Railways' Administration, and telegraph stores by the North Eastern Railway Co. (Page 547.)

WE give a few particulars of the additional gas power plant at Accrington.—The Hove Corporation has decided to retain the electricity undertaking in its own hands.—The Maidstone Borough Electrical Engineer again deplores the absence of hire and hire-purchase powers. (Page 548.)

**The Institution of Electrical Engineers.**—The opening meeting of the Institution session will be held on Thursday, October 29th, at 8 p.m., when the President, Sir John Snell, will deliver his inaugural address. At this meeting a marble bust of Michael Faraday will be presented to the Institution by Mr. Llewellyn Preece, on behalf of the family of the late Sir William Preece.

**"Lethargy amongst British Manufacturers."**—A correspondent writes us as follows:—"I have read your 'Appeal to Manufacturers,' in ELECTRICAL ENGINEERING of August 20th, but I am afraid it has fallen on deaf ears. There is a lethargy amongst British manufacturers which is absolutely appalling. To give you an example:—My company has influential friends in Russia, and one of these parties wrote and asked us to find him an agency for aniline dyes. We wrote round to all the manufacturers, and the majority of the answers which we have had are that they are so busy, or that they are so overwhelmed (or something to that effect), that they cannot give attention to the matter. Other friends of ours in Russia have conditional orders with money deposited for enormous quantities of certain substances of which there is a very limited output in this country. One manufacturer, on learning that we could give him orders sufficient to keep his works busy for months, informed us that he was too busy already to consider these orders, as they would necessitate the expense of putting down another machine, and then, when the war was over, his new machine would be useless, as Germans would get the business again. This man does not appear to understand that Russia will not buy from Germany again if she can buy elsewhere, and our friends the Americans will probably capture the trade that England ought to get. Yet another example:—I am informed by the London agent of a provincial maker of high-class switchgear that he received an inquiry from Scandinavia for a certain starter which they had previously been purchasing from Germany for the price of £2. There is no doubt that this British maker could obtain the whole of that Norwegian business, but he stood on his dignity, and he would not condescend to manufacture the kind of stuff that the Germans make because it would injure his reputation."

**Arrangements for the Week.**—(To-day) Thursday, October 15th, Greenock Electrical Society, 21 West Stewart Street. "Alternating Current," by J. H. Parker, 7.45 p.m.—Saturday, October 17th, Birmingham Electric Club, Swan Hotel, New Street. "The Design and Re-Design of Industrial Works," by A. Home-Morton, 7 p.m.—Monday, October 19th, Institution of Post Office Electrical Engineers, I.E.E., Victoria Embankment. "Ethics of Supervision," by A. S. Renshaw, 6 p.m.—Friday, October 23rd, Physical Society, Imperial College of Science, Presidential Address on "Ionisation," by Sir J. J. Thomson, F.R.S., 8 p.m.

## ELECTRICAL DRIVING AT A MOTOR CAR WORKS

THE automobile construction works established by Arrol-Johnston, Ltd., some two miles out of Dumfries is a very fine example of an up-to-date factory, where, in accordance with the universal trend of manufacturing engineering, the fullest advantage is taken of the economies available from electrical driving of the machinery. We have been kindly sent a complete illustrated description of the electrical arrangements by the General Electric Co., Ltd. (Witton,

FIG. 1.—PART OF GENERATING PLANT.

Birmingham, and 67 Queen Victoria Street, London, E.C.), through whose Glasgow office the contract for the entire electrical equipment was carried out.

The power-house is driven from a suction gas plant, and contains generating plant aggregating 625 kw., comprising two 140-kw. and three 115-kw. Witton generators, belt-driven by slow-speed horizontal gas engines. A general view of part of the interior of the power-house, including the switchboard, is shown in Fig. 1. Power is generated at 220 volts, continuous-current, and is controlled by a switchboard of the open-type with five generator and five feeder panels. For lighting the works when the larger plant is shut down a

FIG. 2.—INDIVIDUALLY-DRIVEN AUTOMATIC MACHINES.

15-kw. gas-electric set has been installed in a smaller engine-house near by. The constructional processes have been so arranged that castings and raw material are taken in on the top floor and gradually descend as they are machined, and assembled, until the finished product reaches the ground floor. In the automatic machine shops the larger machines are individually driven, while the smaller ones are arranged in groups driven through Coventry chains by 20-h.p. Witton motors running at 1,100 r.p.m. An example of the individual driven machines is shown in Fig. 2, illustrating a four-spindle Gridley automatic machine driven by a 10-h.p. Witton motor. The motor-starter and a "Salford" switch controlling this and other similar machines will be seen on the right-hand

side. An idea of the extent of the automatic machine shop will be gathered from the fact that there are no less than twenty 20-h.p. groups of automatic machines. In the case of minor processes, it has been made a practice to group the necessary tools together and drive them from a 20-h.p. Witton motor fixed on the ceiling. Amongst the machines so driven are a number for running-in the gears, as well as saws and drills. In the Body Department the wood-working tools are also grouped.

One of the interesting details of the plant is a bank of machines for fixing the buttons on the cushions and upholster-

FIG. 3.—CRANK SHAFT TESTING MACHINE.

ing, splitting the leather and similar work. In the polishing shops a 25-h.p. Witton motor drives a long bank of polishing machines, the air from each of which is taken by means of a hood connected to a fan driven by a 5-h.p. Witton motor. Paint-shops usually offer little scope for electric drive, but here electric motors are used for driving air compressors and vacuum machines. The paint for the wheels is atomised and sprayed by compressed air, the operation being conducted in a hood from which the air is continuously exhausted, removing the paint fumes from the atmosphere of the room. At the moment only a 2-h.p. motor is installed, but a larger plant driven by a 20-h.p. motor will shortly be erected for spraying car bodies. Every part in an Arrol-Johnston car is thoroughly

FIG. 4.—ELECTRICAL TESTING OF CHASSIS.

inspected before it is assembled, and an example of the thoroughness with which this inspection is conducted is offered by a crankshaft testing machine which is shown in Fig. 3. This machine is driven by a  $\frac{1}{2}$ -h.p. Witton motor, and the crankshaft is caused to rotate. If the crankshaft be out of balance it oscillates in position and automatically scribes itself at certain points which indicate where the metal needs to be taken off, and at the same time gives the operator an idea by means of a pointer showing the extent of the oscillations what amount of metal needs to be removed to secure perfect blancing. In the Car Testing

Department advantage has been taken of the facilities which electricity offers for the conversion of mechanical into electrical power, and its easy measurement, to adopt electrical methods for testing the cars. This department contains a number of car-testing beds, as well as engine running-in plants. Before testing, each engine is given a prolonged run, being driven direct by a Witton motor. When taken over to the testing-bed, the rear wheels of the car rest on the rollers coupled by a belt to a Witton dynamo. The engine drives the dynamo through the wheels and rollers, the energy generated by the dynamo being used up in a resistance situated outside the shop. The switchboard for measuring and controlling the power generated by the dynamo is seen behind the car. In this way precise information is gained as to the performance of the engine, and assurance is made that the engine is running to perfection.

The foregoing description gives but a small idea of the extent of the works. No mention has been made of the tool-room with its two 20-h.p. motors, the erecting shop with its 5-h.p. motor, the foundry with its one 15-h.p. and two 5-h.p. motors, the smithy, the copper-shop, and the numerous other situations in which Witton motors are installed for various purposes. The whole of the building is lighted by Osram lamps, there being 550 lighting points, and 150 plugs for power and light. Messrs. Claud Hamilton, Ltd., of Glasgow, were the contractors for the wiring. In conclusion we have to express our indebtedness to Mr. T. C. Pullinger (Managing Director of Arrol-Johnston, Ltd.) for permission to publish this article, and to Mr. Robert Bailie, the Company's electrician, under whose charge the electrical installation was carried out.

### THE "MUSEUM" TELEPHONE EXCHANGE

WE recently had an opportunity of inspecting the newest London telephone exchange, known as "Museum." The name is not intended to reflect in any way on the apparatus—which is of the most modern description—but is merely a roughly approximate designation of the locality in which the exchange is situated. It is in Chenies Street, Tottenham Court Road, a quarter of a mile from the British Museum. The exchange was opened last April with only 600 subscribers, and there are now 1,400. As it is practically fully equipped for 10,000, it is seen that there is plenty of provision for new subscribers in the district. It may be

is practically the Stone central battery system. Repeating coils are used on the cord circuits of the junction position only, and not on the subscribers' sections of the board. In the latter, the two halves of the circuit are connected through condensers, and the tip of the plug is connected directly to the battery through the supervisory relay and the ring of the plug to the battery through an equivalent retardation coil. The connections are seen in the diagram below. As indicated in this diagram also, all the relays, condensers, and retardation coils are placed on racks (which are at right angles to the switchboard), and not on the board itself. The only exception is the condensers and repeaters for the junction positions, which are on one rack in the apparatus room downstairs.

The switchroom contains 120 A positions and 42 B positions; two of the latter are for signalling junctions, the rest order wire. A nine-panel multiple is used on the A positions and a six-panel on the B positions. On the subscribers' board there are three operators' positions for every eight panels, and seventeen cords per position; and on the B board there are thirty junctions per position. In accordance with latest practice, the junctions have automatic ringing, so that on the insertion of the plug in the B position a relay connects the ringing circuit to the wanted subscriber's line, and he is continuously rung until he unhooks his receiver or until the originating operator clears. An interesting detail which we noticed is that the outgoing order wires, instead of being multiplied in the ordinary way and connected through solid, are each branched at tabs behind the board into four circuits which pass through break-jacks all together at a corner of the switchboard and thence to the order wire keys. Thus, if an order wire key becomes defective, it is possible to test at the break-jacks to see which of the four groups of keys it is on, and the remaining three groups need not be disturbed or the order wire itself put out of use. This arrangement has already been used in some other London exchanges, and has proved convenient.

The central battery is an eleven-cell Tudor battery with a capacity of 4,500 ampere-hours at the nine-hour rate. It is fully equipped with all its plates, and is contained in lead boxes. To prevent the boxes from bulging there are two wooden battens on each side of the box, braced together with heavy lead-covered iron rings.

There are two alternative sources of supply for charging the battery through the usual motor-generators; one from the County of London Co.'s mains at 590 volts D.C., the other from the Metropolitan Electric Supply Co.'s mains at

explained, however, that the exchange is not entirely for new subscribers, but also to relieve Gerrard, Mayfair, North, and even City and Central, upon all of which there have been several subscribers in the district now served by Museum.

The exchange is the largest one in London equipped by the Automatic Telephone Mfg. Co., Ltd., but it is not automatic; this Company, it will be remembered, took over all the telephone manufacturing done by the British Insulated & Helsby Cables, Ltd., a few years ago. The system employed

200 volts D.C. As usual, also, one ringing machine is run from the central battery and one from the supply mains.

We have to thank Mr. Slingo, the Engineer-in-Chief to the Post Office, for permission to view the exchange, and Mr. F. Woollard, the Assistant Sectional Engineer, for conducting us over it and explaining its characteristics to us.

Scottish Local Section of the Institution of Electrical Engineers.  
—All communications for the section should be addressed to Mr. J. Taylor, Hon. Sec., 153 West George Street, Glasgow.

each other; hence the L.T. connections of one transformer must be reversed. If now no deflection is observed when the supply voltage is raised, the ratio of the transformer is correct, but care must be taken to see that no open-circuit exists in the secondary circuit. This can be done by switching off supply momentarily and moving the dial switch to 53 or 55 (in this case), and on closing main switch again a reading should be observed if secondary circuit is continuous. If an exact ratio cannot be obtained on the standard transformer the nearest higher and lower ratios obtainable should be tried, and the ammeter should indicate first in one direction, and then in the other, showing that the correct ratio is between the two. If, when the transformers are connected in opposition, the ammeter indicates with the correct standard ratio, then each coil of the transformer under test should be tested separately until the fault is located. The supply voltage must, of course, not be greater than that of the H.T. side of the transformer to be tested; but in any case a maximum limit of, say, 2,000 volts should be fixed, this generally being the maximum the standard transformer will stand.

### PENDING ELECTRICAL LAWSUITS

**A**MONG the cases down for hearing in the Michaelmas sittings which have just commenced is an application for a compulsory licence under the drawn-wire metal-filament lamp patents in rather interesting circumstances. The Robin Electric Lamp Co., Ltd., own a patent taken out by Mr. J. T. Robin for a double-filament lamp. The lamp contains two independent filaments of the same size, connected to two pairs of contacts in the cap, and by an ingenious arrangement of a ring round the cap (which is of special shape) the lamp can be turned in the holder when the first filament burns out, and is thus given a new life. The Company apparently were not particularly desirous of manufacturing the lamp filaments themselves, nor even the lamps, but they have been unable to come to arrangements with any of the firms working under the drawn-wire patents which would enable them to put the new lamp on the market at what they consider a sufficiently low price. They therefore applied last year to the Board of Trade for a compulsory licence under the patents in question, in accordance with Section 24 of the Patent Act, and the Board have remitted the case for trial in the High Court. The case should come before Mr. Justice Sargant within the next few weeks, if not postponed, and a stiff fight may be anticipated. The Robin Electric Lamp Co., Ltd., have applied for a compulsory licence under the Siemens patents 20,277/04, 3,174/07, 19,932/08, and the B.T.-H. patents 21,513/06, 16,530/07, 23,499/09, 2,759/10, 8,031/10, and 17,722/11, and they have retained Mr. Bousfield, K.C., and Mr. Cave, K.C.

Three other important actions for alleged infringement of the Osram lamp patents are also down for hearing in the Chancery Division. Two of them, against Pope's Electric Lamp Works, Ltd., and the Gabriel Lamp Co. respectively, will come before Mr. Justice Joyce, whilst the third, against the Corona Lamp Works, Ltd., is on Mr. Justice Sargant's list.

Two other lamp patent cases in which writs are known to have been served do not appear on the list. One of these was against Messrs. Dick, Kerr & Co. and W. H. Scholey & Co., alleging infringement of the B.T.-H. patents by the "Britannia" lamp; it is doubtful whether this will be proceeded with, as there are reports of a settlement being probable. The other is against Duram, Ltd., and the companies which use their filaments; it is also being brought by the B.T.-H. Co., but presumably the preliminary stages are not completed yet.

Two interesting appeal cases will be heard. The first one, which comes from the Chancery Division, is an appeal by the Long Eaton Urban District Council against the judgment of Mr. Justice Sargant (ELECTRICAL ENGINEERING, May 14th, p. 266), who held that a supply authority has no right to charge different rates of power depending on whether or not the consumer lights his premises by electricity. Incidentally, it may be mentioned that an action relating to preferential charging and hiring without powers at the instance of the Ilford Gas Co. against the Ilford Urban District Council, is not on the list for this sittings.

The second appeal case is of considerable importance to consulting engineers, relating, as it does, to the liability of the consulting engineer under contracts. In this instance, Mr. Justice A. T. Lawrence, in the King's Bench Division, held that Messrs. Kirkland and Capper, Consulting Engineers to the War Office for the wiring of the Royal Army Medical College and Laboratories at Millbank, were negligent in permitting lead-covered wire to be placed under plaster without other protection, and gave damages against them and the

architect. We reported the case in our issues for April 23rd, p. 224, and May 14th, p. 267.

The action by Venner Signs, Ltd., against Stella Signs, Ltd., for alleged infringement of patents, referred to in our issue for June 25th, p. 369, has already been settled by the Stella Co. giving the necessary undertaking.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

On another page will be found a description of the "Museum" telephone exchange, one of the new exchanges opened in London this year. In this connection it is interesting to note that the Engineering Department of the Post Office is not slackening its work in any way, and that, after allowing for the men who have joined the colours, there are still some 17,000 at work. Last year 5½ millions were spent by the Post Office on construction work, and this year it is probable that the above amount will be considerably exceeded. The equipment of full automatic exchanges in the provinces is proceeding. As is known, Epsom and Hereford are already working, and automatic exchanges in Stockport, Dudley, Blackburn, Purley, Accrington, Chepstow, and Grimsby are in course of construction. With the exception of the "official switch" at the G.P.O., no full automatic exchanges are contemplated in London itself.

At the West London Police Court on Thursday, Morgan Adolf Watsdorf, nineteen, a clerk, living at Shepherd's Bush, was charged on remand with working a wireless telegraph apparatus without a licence. We reported the first hearing of the case in our last issue. No further evidence was given, and the prisoner was committed for trial, bail being refused. The case was down for hearing at the Central Criminal Court to-day, but had not come on when we went to press.

On the 6th inst. the lines between Saigon and Bangkok failed, but were repaired on Monday.—Brazil has prohibited the use of wireless on ships in territorial waters, and has instituted censorship, &c., on all telegrams, which must be written in plain language.—The Cape St. Jacques-Doson cable was repaired on the 9th inst.—The Sitka-Valdez cable gave out on the 11th inst., and traffic is, as usual, being sent *via* Ashcroft, excepting for Juneau, Skagway, Ketchikan, Wrangel, &c.—The Ottoman Government again permits the use of abbreviated or code addresses in telegrams for Turkey.—The following cables are still down: The Pacific cable and those between Tsingtau and Chefoo and Tsingtau-Shanghai, Australia and New Caledonia, Azores-Emden, La Réunion and Mauritius and Madagascar and Réunion.

**London Electric Supply.**—At the meeting of the London County Council on Tuesday it was agreed, without discussion, to promote next session the electric power scheme for London, details of which were given in our issue for July 30th, p. 428. The deputation from the Islington Borough Council to the conference between the L.C.C. and the London Boroughs with regard to the scheme has reported that the general view at the conference seemed to be that the Borough Councils are not yet in possession of sufficient information to enable them to form a judgment as to whether the scheme will be beneficial to them or not. The London County Council, we understand, has promised to furnish the Boroughs with further particulars. The Press was not admitted to the conference in question.

**L.C.C. Cable Employees' Rates of Pay.**—The following rates of pay have been decided by the arbitrators appointed by the Electrical Conciliation Board to consider applications from the leading and ordinary cable hands employed on the southern section of the L.C.C. tramways, and wiremen and wiremen's labourers in the electrical section of the Tramways Department, for increases in rates of pay. The arbitrators consisted of Sir D. Harrel (Chairman), Sir A. K. Butterworth, Mr. R. J. Smith, K.C., Mr. C. W. Bowerman, and Mr. J. N. Bell. Leading cable hands at present receiving 8d. per hour are to receive 8½d.; those receiving 7½d. to receive 8d.; and ordinary cable hands at present receiving 7d. to receive 7½d. These increases date as from July 20th, 1914. Wiremen in the Depot Wiring Department at present receiving 9½d. are to receive 10d. from May 14th, 1914, and to receive any increase subsequently granted to the wiremen at the Central Repair Depot before April 3rd, 1916. Wiremen's labourers' wages to be increased from 6½d. to 7d., and from 7d. to 7½d. respectively as from July 20th, 1914.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published October 8th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

20,725/13. **Lamp Holders.** E. DONSON (Foster Engineering Co.). In these lampholders fixed contacts are used instead of spring plungers, and the outer case with the bayonet slots is capable of axial movement relatively to the contact carrier, and is held back normally by a spring. It is, however, provided with additional bayonet slots engaging with pins on the base, so that it can be locked in the pulled out position when it is desired to break contact with the lamp without removing it from the holder. Seven figures.

20,990/13. **Electric Torch.** J. AIKMAN. A small magneto generator is contained within the body of the torch actuated through gearing by pressure on a knot with a free wheel return arrangement. This charges a small accumulator which supplies the lamp. One figure.

22,926/13. **Plug and Socket.** E. H. LEONARDT. The interior of the socket is similar to a lamp holder with the spring plungers replaced by split pins, and surrounded in place of a shade ring by a screwed skirt fitting round the plug. Over this skirt is a series of springs which engage with a collar on the plug to retain it in place when inserted. Two figures.

26,657/13. **Shade Carrier.** T. MCCLELLAND. This very simple shade carrier clips on to the lamp-holder in the position usually occupied by the shade ring, and is made of a piece of wire shaped to form a partial ring, and having its ends projecting to form legs. One leg is bent in such a manner that when pressed against the other it causes the ring to expand so that it can be disengaged. Four figures.

9,611/14. **Track Circuits.** W. H. DAMMOND. In order to eliminate the effect of foreign currents, the track circuits are arranged with an additional line conductor as a three-wire system, and a special three-wire electromagnetic relay is adopted. One figure.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Arc Lamps:** DOWDELL [Contact devices] 5,693/14.  
**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B. T.-H. Co. [Power systems] 21,689/13; HUNTINGDON [Cable suspenders] 231/13.

**Electrometallurgy and Electrochemistry:** NIBLETT [Electrolytic apparatus] 24,560/13; ASHCROFT [Electrolytic preparation of alkali metals, alloys and compounds] 25,144/14.

**Heating and Cooking:** THOMAS and THOMAS [Ovens] 22,402/13.

**Ignition:** HOLLISTER [Magnetos] 21,472/13; BLUEMEL and BLUEMEL BROS., LTD. [Spark plug] 719/14.

**Incandescent Lamps:** BASTIAN [Glow lamps] 21,029/13.

**Switchgear, Fuses and Fittings:** GOULTON [Signs] 21,191/13; WALLER and RODWAY [Fuses] 23,492/13; HOLT and SMITH [Circuit breakers] 25,477/13; OLMSTEAD [Voltage regulators] 26,623/13.

**Telephony and Telegraphy:** CREED, and CREED, BILLE & Co. [Telegraphy] 19,125/13; KENNEDY and TURNER [Telephone exchange apparatus] 21,921/13; GELL [High speed telegraphy] 22,146/13.

**Traction:** BLACKALL and JACOBS [Signalling] 13,157/13; WOLLERS, McCAW and WOLLERS [Electric lock for carriage doors] 12,982/14.

**Miscellaneous:** GADD and WESTERN DENTAL MANUFACTURING Co. [Electrically heated dental hot air syringes] 21,997/13; TUDOR [Bells] 30,017/13; DEAN [Electric horns] 5,346/14; T. CROSBEE & SONS and ROGERS [Alarms] 10,473/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, &c.:** KETTERING & AUR. [Engine starters] 13,057/14.

**Electrochemistry:** GES. FÜR ELECTRO OSMOST [Electro-osmotic treatment of materials] 19,849/14.

**Incandescent Lamps:** DEUTSCHE GASGLÜHLICHT A.-G. [Incandescent lamps] 19,729/14.

**Switchgear, &c.:** MOULIN [Limiter of discharge of batteries] 10,511/14.

**Miscellaneous:** GEB. SULZER [Governors for petrol-electric vehicles] 13,706/14.

### Applications for Suspension of Patents

10,859/01 and 24,439/02. **Alumino-thermic Welding.** H. GOLDSCHMID (Essen, Germany). Applications for the suspension of these patents made by W. L. Turner and H. A. Blackwell will be heard on October 21st. These patents cover the well-known process of "Thermit" welding more particularly as applied to tramway rail-joint welding.

6,116/12. **Electric Control of Compressed Air Brakes.** W. HILDEBRAND and KNORR, BREMSE A.-G. (Berlin). A licence under this patent has been granted on the application of Allen West & Co., Ltd.

### Amendments Made

5,210/09. **Sparking Plugs.** B. HOPPS. This specification, which is for sparking plugs with the inner electrode secure by a fusible refractory enamel, making a gas-tight joint, has been amended with a view to limiting the scope of the invention claimed.

17,124/13. **Indicating Apparatus.** SIEMENS BROTHERS & Co., LTD. (Siemens & Halske A.-G.). This specification has been amended by way of disclaimer. It relates to the electrical transmission of the indications of observing instruments such as range-finders, in which several instruments are used, and the arithmetic mean of their observations automatically transmitted.

### Expiring and Expired Patents

The following Patent expires during the current week, after a term of fourteen years:—

18,617/00. **Circuit Breakers.** B. T.-H. Co. (E. M. Hewlett, U.S.A.). Oil or other high-tension circuit breakers controlled from a distance in which the contacts are closed through a mechanism by an electric motor, but opened quickly by a spring arrangement independent of, but controlled by, the motor.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Electrochemistry and Electrometallurgy:** H. A. IRVINE [Electric furnace] 13,032/01.

**Heating and Cooking:** F. KRUPP A.-G. GERMANIAWERFT [Electric air heater] 9,449/08.

**Switchgear, Fuses and Fittings:** A. E. VOSS [Flashers] 13,361/08.

**Traction:** H. LEITNER and R. N. LUCAS [Train Lighting] 12,945/05.

**Miscellaneous:** A. P. JONES (Long Arm System Co., Cleveland, U.S.A.) [Electric door opening and closing apparatus] 13,927 & 8/04; H. H. LAKE (Ingersoll Sergeant Drill Co.) [Control of electrically driven air compressors] 12,778/05; C. O. BASTIAN [Mercury vapour lamps] 13,158/05.

**The Association of Supervising Electricians.**—This Association held its first meeting of the session at St. Bride's Institute, Ludgate Circus, on September 29th. Some eighty members and visitors assembled to hear the Presidential address, which was followed by a Paper dealing with Private Generating Plants, read by the President, Mr. A. H. Dykes. A reference was made to the necessity of having an Association to bring into closer touch with one another, supervisors and foremen of the electrical contracting trades. An interesting discussion followed, and a number of technical questions which had been asked, were explained by the lecturer, Mr. W. R. Rawlings,

who is an Honorary Member, made a brief speech congratulating them on bringing together such a large number of members, so thoroughly representative of the electrical contracting trades. The hon. secretary announced a series of Papers, which will be read during the session, the respective subjects, amongst others, being:—A.C. Commutator Motors, Wiring Systems, D.C. Motors, Telephones and Lightning Conductors. The inaugural dinner will be held at the London Tavern, Fenchurch Street, on November 28th. Particulars of the Association and rules can be obtained from the Hon. Secretary, Mr. C. J. Banister, 14 Pulborough Road, Southfields.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**LANTERNS AND FITTINGS.**—A new supplementary catalogue has been issued by the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), with an attractive cover depicting a scene in an Indian town, where the company's "Barrow" system of street lamp suspension is used. A number of patterns of shop front and general exterior lanterns are listed, as well as semi-indirect fittings, some for half-watt lamps, and fittings for suspended street lighting. Owing to the difficulty in obtaining supplies of sheet zinc and other materials, this company has been obliged to advance prices by 10 per cent.

**ELECTRIC BELLS.**—The Sterling Telephone & Electric Co., Ltd. (210-212 Tottenham Court Road, W.), have sent us a leaflet relating to a cheap metal case bell which they are selling at a very low price. It is stated to be British made throughout, and the Company announce that the large extensions completed some time ago at their works in Dagenham, have made them entirely independent of supplies from the Continent. The Company also announce an advance in their rate of trade discount.

**METAL FILAMENT LAMPS.**—A leaflet from L. Andrew & Co. (2 Whitworth Street West, Manchester) gives prices of "Wrendal" metal filament lamps of British make.

**PRINTING PRESS DRIVING.**—A leaflet from the Igranic Electric Co., Ltd., describes their latest form of push-button control with solenoid starter suitable for small rotary printing machines driven by single motors.

### "THERMOID" FLEX

A NEW type of flexible cable has been introduced by W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, E.C.), under the name "Thermoid," for use with electric heating and cooking apparatus. The conductors are of steel and copper wire, and this not only ensures strength and flexibility, but is also a safeguard against kinking, so that for such apparatus as electric irons the new cable should be very suitable. The insulation is specially designed to be heat resisting, and the outside covering is of worsted and glacé cotton to render it flame resisting. Three sizes are listed—4 ampere (equivalent to 20 S.W.G.), 6 ampere (equivalent to 18 S.W.G.), and 10 ampere (equivalent to 16 S.W.G.). It is made either ordinary twin or circular twin, and, as the prices are moderate, it should have an extended use. Messrs. Henley's invite applications for samples from anyone in the trade.

**Ozonair and Recruiting.**—It is of interest to know that on the occasion of Mr. Asquith's recruiting speech at Cardiff on Friday, the 2nd inst., representations were made to those who were attending to the arrangements that the Premier was troubled with asthma, and that an Ozone generator should be installed under the table at which he was to speak, for the purpose of giving him relief. At very short notice this matter was taken up by the Corporation Electric Supply Department, and the local branch of the Edison & Swan United Electric Light Co., Ltd., who communicated with Ozonair, Ltd., by telephone. The latter firm sent down one of their Ozonair machines, and this was installed in an adjoining room, the ozonised air being brought by means of a tube to a position under the Premier's table. It is understood that the result was an unqualified success, and this is proved by the vigour of the Premier's speech, which was no doubt largely instrumental in giving a great impetus to the recruiting movement in South Wales. Incidentally it may be stated that over 50 per cent. of the staff of Ozonair, Ltd., have enlisted in the National Services, and that one of their men is a Naval Reservist and was among those who were fortunate enough to be saved from the *Hogue*, and has now joined another cruiser.

**Trading with the Enemy.**—The Oliver Arc Lamp Co., Ltd., have sent us the following circular letter received from an Amsterdam firm—whose name we suppress for obvious reasons: "Dear Sirs, We herewith beg to inform you that we are in a position to supply you *all Continental electric articles* advantageously. Should you require anything, we should be glad to hear from you. Yours truly ——" The words in italics are spaced out in the letter and underlined. Needless to say the Oliver Company—and we hope none other of our readers who have received this letter—are likely to avail themselves, in present circumstances, of the services of a firm desirous of supplying *all Continental articles*.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Australia.**—The Sydney Corporation requires generators and switchgear for electric vehicle charging. Town Clerk. December 21st. Specification may be seen at 73 Basinghall Street, E.C.

**Blackpool.**—C.I. distribution pillars; H.T. and L.T. cable; earthenware conduit. Borough Electrical Engineer. (See advertisement on another page.)

**Bromley Cross (Lancs.).**—A Local Government Board inquiry was held last week concerning a loan of £3,815 for an electric lighting scheme. Power is to be supplied by the Lancashire Electric Power Co.

**Dover.**—Several extensions of mains are to be carried out.

**New Zealand.**—A supply of D.C. meters is required by the Gisborne Council: Electrical Engineer, Carnarvon Street, Gisborne. December 5th. This information, of course, is only of value to firms having agents in New Zealand who can be instructed by cable.

**Salford.**—Sanction to a loan of £13,500 is to be applied for. It is proposed to instal a 5,000-kw. turbo-alternator at the Frederick Road power station.

**Southport.**—The borrowing of £10,000 for the general purposes of the electricity undertaking is contemplated.

**Teignmouth.**—An agreement has been entered into with Dr. Purves, of Exeter, with regard to an electric supply scheme.

**Walsall.**—A loan of £23,595 is to be sought in connection with the electricity undertaking.

**West Bromwich.**—Sanction has been received from the L.G.B. for the borrowing of £5,547 for new generating plant and cable.

#### Miscellaneous

**Glasgow.**—A twelve months' supply of lamps and fittings for the Glasgow Parish Council and District Board of Control. Clerk, 266 George Street. October 26th.

**North-Eastern Railway Co.**—Six or twelve months' supplies of telegraphic material are required. Telegraph Superintendent, York. October 23rd.

**South Africa.**—The South African Railways Administration require 14,080 incandescent lamps, and 39,150 train-lighting lamps, all wire-drawn filaments. Tenders to Headquarter Offices, Johannesburg. November 2nd. This information is only of use to firms having agents in South Africa who can be instructed by cable.

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**London: L.C.C.**—The tender of Davidson & Co. has been accepted at £4,898 10s. for four induced-draught fans at the Greenwich Generating Station. The motors will be supplied by the B.T.-H. Co., and the starting switchgear and resistances by Brook, Hirst & Co.

On page 473 of our issue for August 27th we referred to the contract given to J. Batt & Co. for the supply of 3,000 driving and 2,000 pony wheel tyres for L.C.C. tramcars. Messrs. Batt, as agents for a Cologne firm, were unable to carry out the contract at the time of our previous note; but the contract had not been cancelled, as the firm was then endeavouring to find a British firm to take it over as sub-contractors. At that time, however, the L.C.C. had also ordered a similar quantity of tyres from Messrs. H. Besemer & Co., whose tender in July was the next lowest, viz., £1 3s. each for the driving wheel tyres, and £1 each for the pony wheel tyres, compared with 19s. 4d. and 16s. 7d. respectively quoted by Messrs. Batt. The Highways Committee now report that in addition a contract has been placed

with Cammell, Laird & Co. for 500 driving wheel tyres at 22s. each and 500 pony wheel tyres at 19s. each, as Messrs. Batt are unable to fulfil their contract.

The following tenders have been received for the supply of 125,000 metal-filament traction lamps: Siemens Bros. Dynamo Works, £6,313 2s. 6d.; alternative tender, £7,816 5s.; Edison & Swan Co., £7,816 5s.; Electric Co., £7,816 5s.; General Electric Co., £8,450. The tender of Siemens Bros. Dynamo Works at £6,313 2s. 6d. has been accepted, the amount to be increased to £6,628 15s. 8d. if frosted bulbs are required.

### APPOINTMENTS AND PERSONAL NOTES

Mr. J. H. Clothier, Chief Electrical Engineer to the St. Anne's-on-Sea Corporation has received an increase of £50 per annum in his salary.

The Newcastle-on-Tyne Electric Supply Co. has vacancies for junior assistant engineers. Applications to the Engineer, Carville Power Station, Wallsend-on-Tyne.

Mr. J. Hammersley has been appointed Resident Engineer in Manchester for Home-Morton, Ker and Gibson, Consulting Engineers.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, the following may be taken as the official quotation for electrolytic copper bars, viz., £55 to £55 10s. (Last week, £54 10s. to £55.)

**Business as Usual.**—Notwithstanding the fact that Mr. Curtis, of the Curtis Manufacturing Co. (Conduit Place, Paddington), has joined the Engineer Unit of the Royal Naval Division, and is in camp at Martin Mill, this firm inform us that business in continuing as usual in his absence.

**Italian Agency.**—A Palermo firm desires to get into communication with United Kingdom manufacturers of electrical material, including metal-filament lamps. Further particulars at 73 Basinghall Street, E.C.

**Liquidations.**—The statement of accounts in the liquidation of the Consolidated Diesel Engine Manufacturers, Ltd., shows gross liabilities of £72,492, of which £43,222 is expected to rank, and assets estimated to produce a surplus of £240,078. The deficiency as regards shareholders is returned at £358,878. Mr. W. J. Warley, the official receiver, said it was agreed that there had been great want of judgment on the part of the Directors, but there was not sufficient ground upon which to found any claim against them. Sir William B. Peat, who was appointed Special Manager a short time ago, recommended that the works at Ipswich, in which some work is still going on, should not be sold, but that the opportunity be taken to let them temporarily to the Military Authorities for the accommodation of troops. This was done, but the arrangement has now come to an end. Sir William Peat has been appointed liquidator.

Mr. Justice Neville, in the Chancery Division on Tuesday, made a compulsory winding-up order against the Leitner Electrical Co., Ltd. Application was made on behalf of Alfred Herbert, Ltd., who have a debt under an ordinary contract amounting to £650, and it was supported on behalf of Messrs. Greenwood and Batley, who have a debt against the Company of over £2,000. There is also another creditor for a similar amount.

**Bruce Peebles and the War.**—Mr. R. Shaw, Chief Estimating Engineer to Bruce Peebles & Co., Ltd., Edinburgh, has joined the Engineer Units of the Royal Naval Division, and Mr. W. Oliver has been appointed temporarily to fill Mr. Shaw's position. Since the outbreak of hostilities well over one hundred members of the staff and works have joined the Forces, and unfortunately the firm have already received intimation that one of their men has been killed in action.

**The Leskole Co., Ltd.**—The business of this Company, formerly carried on at Palace Works, Enfield, has been taken over by the Cambridge Scientific Instrument Co., and Mr. F. Wakeham, Assistant Manager to the Leskole Co., has joined their staff.

### LOCAL NOTES

**Accrington: Additions to Gas Power Plant.**—The scheme of duplicating the existing gas-engine driven generating plant which has been entrusted to the Power Gas Corporation comprises two 1,000-h.p. gas engines with exhaust boiler coupled to a 750-kw. alternator, and a 750-kw. dynamo, both by Bruce Peebles & Co. When the installation is complete the gas plant at the power-house will consist of 4,000 h.p. The engines are being made by the National Gas Engine Co.

**Bacup: Transfer of Management.**—Hitherto electricity has been supplied to and distributed in Bacup by the Rawtenstall Corporation, but the Bacup Corporation has now decided that, whilst continuing to take energy from Rawtenstall, it will take over the actual management of the distribution itself.

**Hove: Electricity Undertaking.**—The Corporation has at last decided to retain the undertaking of the Hove Electric Lighting Co. in its own hands. It will be remembered that the undertaking was recently acquired by the Corporation on a valuation; but considerable doubt has existed as to the future management of it. Several offers to lease the undertaking have been received, but under the advice of Sir Alexander Kennedy none of them were considered sufficiently attractive. Mr. C. B. Smith, the Engineer who managed the works on behalf of the Company, is continuing to do so as an official of the Corporation.

**Edinburgh: Public Lighting.**—A short time ago the Electricity Committee agreed to reduce the price for public lamps from £9 to £7 10s. per annum, including all-night and half-night lighting. The Corporation has now decided to do away with the half-night lights, and the question has been raised as to how far this materially alters the situation as regards the reduced price. The reduction in lighting was not contemplated when the lower price was agreed to, and the matter has been remitted to a Sub-Committee to deal with.

**Leeds: Purchase of Roundhay Co.**—The L.G.B. has sanctioned a loan of £17,600 for the purchase of the Roundhay & District Electric Lighting Co.

**Maidstone: Electricity Accounts.**—After meeting capital charges amounting to £5,790, there was a surplus of £712 upon the working of the electricity undertaking last year, in spite of very adverse circumstances. The price of coal was 40 per cent. in excess of that of the first half of 1912-13, whilst the new plant which was expected to be ready in October, and from which great economy will be obtained, was not available until nearly the end of March. Thus, during the whole winter it was necessary to generate a large proportion of the output by the small uneconomical sets, with bad results to the coal costs. The output for every class of supply shows an increase, whilst in the supply for power there was a record increase of over one-third of a million units, and once again Mr. E. E. Hoadley, the Borough Electrical Engineer, deplores the absence of powers to hire and hire-purchase the necessary apparatus. There are signs, however, he says, that the possession of powers will not be very much longer delayed. The recent additions to the power plant consist of an 825-kw. Belliss-E.C.C. set, which has a steam consumption of 18 lb. per unit generated, compared with 36 lb. with the old sets.

**Southampton: Report on Electricity Undertaking.**—The joint report by Sir John Snell and Mr. Ernest Edmonds dealing with the general position of the electricity undertaking and the policy hitherto pursued in connection with it (ELECTRICAL ENGINEERING, August 6th, p. 452) came before a special meeting of the Corporation last week. The discussion resolved itself for the greater part into acute differences of opinion between certain members of the Council, and a large number of personalities were indulged in. Several speakers seemed disinclined to accept the opinions of the authors of the report, notwithstanding, it was alleged, they had been responsible for the calling in of the experts. At the end of a long meeting, at which it cannot be said that anything of a practical nature was done, the report was referred to the Electricity Committee, who in turn is to report to the Corporation. The cost of the expert advice amounts to £593 16s., and one member expressed the opinion that this sum was being paid for advice identical in every respect to that already given by their own Borough Electrical Engineer, Mr. H. F. Street.

## SUMMARY

THE Darlington telephone exchange just opened, is the first in this country to employ the Western Electric Co.'s full automatic system. The features of this are the employment of registers and the reversionary impulse control system of operating, the use of rotary sequence switches to displace a large number of relays, and power drive (p. 550).

An illustrated article explains the working of the "split conductor" system of mains protection (p. 551).

A PATENT specification by C. O. Bastian for lamps with helical wire filaments was published last week. Other specifications published at the same time deal with automatic sending apparatus for wireless telegraphy, telephone indicators, circuit breakers, &c. Application has been made for the suspension of certain patents for magnetic clutches. A Marconi wireless telegraph patent expires during the coming week (p. 552).

A MOVING stairway has been opened at the Baker Street station of the Bakerloo and Metropolitan Railways (p. 553).

THE subject of illicit wireless stations is again dealt with in our notes on telegraphy, &c., this week (p. 553).

SOME new heating apparatus is described in our

Trade Section, which also contains an illustrated article on apparatus for drying transformer oil (p. 554).

A QUESTION relating to the effect of overloads on meters is propounded in our "Questions and Answers" columns (p. 554).

FURTHER information regarding German trade is available to inquirers at the Board of Trade (p. 555).

THE Armorduct Manufacturing Co., Ltd.—the bulk of whose capital is held in Germany—endeavoured without success to recover a debt of £1 10s. 6d. in the City of London Court. The judge said that the defendants, who acknowledged the debt, but had refused to pay because they considered the plaintiffs a German firm, had honestly discharged their obligation to this country (p. 555).

CABLE is required at Blackpool, Tunbridge Wells, and Pontypridd; generating plant at Ashton-under-Lyne, Connah's Quay, Heywood, Keighley, and Turton; an electric lighting scheme is to be put into force at Waterford.—Street lighting equipment is required at Swinton (p. 556).

OWING to the shortage of arc lamp carbons at Bury St. Edmunds, high-candle metal filament lamps are to be adopted for street lighting.—A dispute has arisen at Maidstone with regard to the Electrical Engineer's bonus.—It is proposed to place the Leeds Electricity Department under the management of a separate Committee.—The Walsall Electricity Committee has decided to deal in electrical fittings (p. 556).

A 4 PER cent. dividend has been paid by Drake and Gorham for the year to June 30th, 1914.—Although a larger profit was made by Dick, Kerr & Co. for the year to June 30th than in the preceding twelve months, no dividend is to be paid (p. 557).

## INSTITUTION OF ELECTRICAL ENGINEERS' PROGRAMME

THE following is the list of Papers arranged for the first half of the 1914-15 session of the Institution of Electrical Engineers: Oct. 29th, Inaugural Address by the President; Nov. 12th, "Cables," by C. J. Beaver; Nov. 26th, "Power Plant Testing," by W. M. Selvey; Dec. 10th, "Automatic Protective Switchgear for Alternating-Current Systems," by E. B. Wedmore; Jan. 14th, 1915, "The Shape of the Pressure Wave in Electrical Machinery," by Dr. S. P. Smith and R. S. H. Boulding; Jan. 28th, The Sixth Kelvin Lecture: "Lord Kelvin's Work on Gyrostatics," by Prof. A. Gray, LL.D., F.R.S.

Arrangements for the Week.—Friday, October 23rd. Physical Society, at Imperial College of Science, South Kensington. Presidential Address by Sir J. J. Thomson, F.R.S., on "Ionisation," 8 p.m.

Thursday, October 29th. Institution of Electrical Engineers. Presidential Address by Sir J. F. C. Snell, 8 p.m.

## THE W.E. CO. AUTOMATIC EXCHANGE AT DARLINGTON

DARLINGTON has become a town of great importance in the telephone world, for the Darlington telephone exchange, with its 600 telephone subscribers, is the first in which the new automatic system of the Western Electric Co., Ltd., has been adopted. The exchange, which was opened a few days ago, has automatic equipment designed for an ultimate capacity of 2,800 subscribers, and an initial capacity of 800.

This is the third automatic telephone exchange to be opened by the British Post Office. The first was at Epsom, on the Strowger system, which had been previously installed for the "official switch" at the General Post Office in London for intercommunication between the various offices, and is also being put in at several other small exchanges in various parts of the country; and the second was the Hereford exchange, in which the Lorimer system was tried, a system possessing some features of merit and novelty, but apparently no longer an active competitor in this country.

The Western Electric system differs from the Strowger in many points. Instead of the impulses sent out by the subscriber's dial switch acting directly on the various selectors, they are received, in the first place, by a "register," which "stores" them and then actuates the group and final selectors by what is known as the "revertive impulse" control method. Another feature of the system is the employment of a "sequence switch" associated with each selector, which controls the necessary sequence of operations which would

No. 0 sends 10 impulses, No. 1 nine impulses, No. 2 eight impulses, and so on. Each series of impulses is received by a register spindle (Fig. 2), there being a spindle for each digit, and as each spindle is moved a step forward for every impulse the spindles are set to the number desired.

It would occupy too much space to describe in detail the translation of the number registered to the group and final selectors, but the principle is briefly as follows: The register spindle only rotates in one direction, and as it has been set to the complementary number to the number on the subscriber's dial, the remainder of the revolution to reach normal position corresponds to the actual number required—or, to be accurate, to the actual number *plus* one extra impulse required for operating purposes. The spindle of the selector (Fig. 3) is started as soon as the register is set, and as it rotates it sends an impulse back to the register, which moves it on one step, and so on until normal is reached and the selector is then stopped at the number required. This describes the procedure very roughly, without reference to the operations of the sequence switches nor the connection to the junctions between the group selector and the final selector, but it will be sufficient to indicate generally the revertive impulse control method.

Provision is made for the engaged tests and the operation of the "busy-back" if the called subscriber is engaged, the ringing of the subscriber if disengaged, the automatic operation of the originating subscriber's meter only if the called subscriber answers, and the final disconnection when the conversation is concluded.

The junctions at Darlington are dealt with at a manual board. When an automatic subscriber desires to make a call to another exchange, he "dials" No. 12 and gets connected

FIG. 1.—LINE-FINDER.

FIG. 2.—REGISTER SPINDLE.

FIG. 3.—GROUP SELECTOR AND SEQUENCE SWITCH.

otherwise have to be done by a large number of relays. In this connection it is interesting to note that, whereas the new Betulander system, recently described in our columns, is based on the principle of replacing selectors by groups of relays, the Western Electric has been replacing relays by a rotary switch mechanism. All the switches for completing the connections are, in fact, rotary—the vertical field, familiar in the Strowger system, is not employed. Another point of interest is that the system is power driven.

The first operation when a subscriber calls is that a "line-finder" connects his line to a free register. This line-finder is illustrated in Fig. 1. Each line-finder has terminals for 60 subscribers' lines arranged in the form of a segment of a circle over which three sets of brushes are driven, and there are eight line-finders for every group of 60 subscribers. As soon as a subscriber originates a call and operates his line relay, this energises a starting relay common to the group of line-finders, which in its turn energises a clutch magnet and starts in rotation as many of the eight line-finders that are free. These rotate until one of them finds the calling line.

The connection between the line-finders and the "registers," already alluded to, is effected by means of sequence switches. There are 30 of these registers, and each connection circuit has, through a sequence switch, the opportunity of testing six registers to pick an idle one. As soon as the register is in circuit, which in most cases will be almost instantaneously, the subscriber receives a buzz on the line (of quite a different nature to the busy-back), and he then starts sending impulses from his finger dial switch in the usual way. The impulses transmitted are complementary to the numbers on the dial, that is to say,

to a junction position. If he wants to make an inquiry, he dials 14, and gets on to an inquiry operator. If he wants to send a telegram he dials 2600. In-coming junction calls for an automatic subscriber are dealt with by the junction operator by a calling device of the finger-plate type. Originating calls from coin-box subscribers reach a position on the manual board, to enable the operator to supervise the insertion of the coins, and a special line and cut-off relay equipment is provided for the purpose. These subscribers have ordinary C.B. sets; they can, however, be reached in the ordinary way on the automatic board for in-coming calls.

It will be seen that the arrangements have been well thought out, and everything points to successful working. Readers desiring more detailed information with regard to the apparatus and circuits are referred to the July number of the *Post Office Electrical Engineers' Journal*, which contains a long article on the exchange by Mr. J. Hedley, and also to an excellently illustrated book on the Western Electric Machine Switching System, issued by the Western Electric Co., Ltd.

**The Magnetite Arc Lamp.**—An article in the *Electrical World* describes recent improvements in magnetite or "luminous arc" lamp in the way of a new electrode with a large proportion of titanium, raising the efficiency in some cases as high as 0.54 watts per mean spherical. The useful distribution of the light has also been improved by prismatic reflectors.

**The "Dynamicables."**—The committee of this club has decided not to hold any dinners this side of Christmas.

## THE SPLIT CONDUCTOR SYSTEM OF MAINS PROTECTION

ALTHOUGH the "split conductor" system for the automatic isolation of faulty feeders—an improvement on the Merz-Price system, so far as cable protection is concerned—has been in use for some considerable time, and many mains in the Newcastle district and elsewhere are equipped with it, yet we believe that no full description of the method has yet been published. Through the courtesy of Electrical Improvements, Ltd. (Milburn House, Newcastle-on-Tyne), we are now able to explain its details fully to our readers.

The system, which is covered by Patents Nos. 4,004 and 26,857 of 1911, has the advantage that the instantaneous automatic disconnection of the faulty feeder is effected with the simplest arrangement of apparatus and without the use of pilot wires. Its

FIG. 1.—THREE-CORE SPLIT CONDUCTOR CABLE [6,000 VOLT].

FIG. 2.—THREE-CORE SPLIT CONDUCTOR CABLE [20,000 VOLT].

operation is based on the fundamental principle that two similar conductors of equal length, when connected in parallel at their ends, carry equal currents. The core of each feeder is divided into two equal conductors, as shown in Figs. 1 and 2, being lightly insulated from each other—in the case of an overhead line, however, the two conductors corresponding to each core are carried on separate insulators. In either case, at the extreme end the two conductors or "splits" of each core are connected together through a device which operates the switch in the event of the currents being unequal (see Fig. 3).

The principle upon which the operating device depends is as follows:—The two splits are taken through windings of a current transformer connected to produce fluxes in opposition, so that the net effect with equal

FIG. 3.

currents is no magnetisation of the core, and no current is induced in the third or secondary winding. As soon, however, as the currents become unequal, a resultant magnetic flux is produced in the core, and the secondary winding becomes energised and operates the relay. Such an arrangement can be adjusted to work with difference of current in the two conductors of a few amperes only, but, in actual practice, the setting of the relay is determined by the degree of equality obtained in the current through the two conductors, and the relay is set so as not to operate with the largest difference of current likely to occur in the two conductors while there is no leakage of any account. The diagram is drawn for one phase only, but the connections and the current transformer are repeated on each of the three phases.

An essential of all such systems of mains protection

is that the feeder must be disconnected at both ends immediately a fault occurs. Consideration of Fig. 3 will make it clear that at any end of a feeder the extent to which a given leakage will affect the disparity of currents (i.e., the automatic device) will vary with the position of the leakage in the length of the feeder; the effect will be greater the nearer the leakage is to the end in question. Should the leakage occur at the extreme end of the feeder as indicated in Fig. 4, the difference between the two currents in the "splits" at the opposite end will be a minimum, and a comparatively large leakage might be required to trip the switch. To provide against this, an arrangement of apparatus indicated diagrammatically in Fig. 4 is em-

FIG. 4.

ployed. It will be noticed that the direction of the flow of current in one of the windings of the current transformer nearest the leakage is here reversed, i.e., the transformer becomes inductive, and therefore offers impedance to flow of current through it to the leakage. This effect increases the disparity of currents in the other current transformer, and operates the relay. If maximum sensitiveness is required without unduly large current transformers the circuit-breaker is arranged (as shown in Fig. 4) so that, when it operates, the two conductors are separated from one another as well as from the bus-bars. This leaves the leakage on one conductor only, and produces immediate operation of the relay at the other end. The arrangement of

FIG. 5.

dividing the circuit-breaker contacts in this way is equivalent to a current transformer of infinite impedance, and is generally adopted in preference to a current transformer of large impedance.

Figs. 1 and 2, already referred to, illustrate alternative constructions of split conductor cable, and Fig. 1 has the advantage over ordinary cable that, due to the larger curvature caused by the increased over-all size of the core on account of the insulation between the split conductors, the potential stress on the insulation is reduced. This advantage is of importance in the case of cables for working pressures of 20,000 volts and over.

A difficulty which might be anticipated with both

forms of split conductor cable shown, is the possibility of both splits of one core developing equal leakage, due to being damaged simultaneously. But the two alternating current arcs would, in the nature of things, have a constantly varying resistance, and it is very unlikely that the damage would be such that the two fault currents were equal, to within a few amperes, at precisely the same instant. In the case of Fig. 1 in particular the probability of equal currents is remote. The curve in Fig. 5 indicates the fraction of a second for which one conductor would have to carry a slightly larger current than the other to ensure operation of the relays. The relays in question were standard apparatus, not specially prepared for the test.

Another consideration affecting this matter is that the fault would, in a short time, affect the other cores of the cable, and if in any one of the three pairs of

split conductors the leakage current did not balance, this would be sufficient to energise one of the three current transformers, and so actuate the tripping coil of the switch.

The insulation between splits is tested after the cable is laid, for half a minute, with a pressure equal to full working pressure between the core and earth. This is to ensure against breakdown of the insulation due to a potential difference between the splits produced by the drop in one of them when carrying leakage current. Such a test represents a very substantial margin over the worst conditions which would occur in practice, particularly when it is borne in mind that under working conditions there is no potential difference between these conductors, and no stress on the insulation. It is therefore in condition for withstanding momentary pressure.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published October 15th, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

19,125/13. **Wireless Transmission.** F. G. CREED and CREED, BILLE & Co., LTD. Transmission apparatus in which the main signalling circuit-breaking devices are actuated by compressed air controlled either by hand through remote-control circuits or by a Wheatstone or other automatic apparatus. Three figures.

21,029/13. **Metal Filament Lamps.** C. O. BASTIAN. Lamps with wire filaments in helical form, with the convolutions arranged at a distance from one another equal to or less than one-half the diameter of the wire. Two figures.

21,921/13. **Telephone Indicators.** D. H. KENNEDY and J. W. TURNER (H.M. Postal Telegraphs). A telephone indicator which, when operated by an electromagnet, is mechanically locked in the operating position, and is automatically unlocked when a second electromagnet is energised or automatically or mechanically unlocked by some act of the operator, and while unlocked may be operated by an electromagnet automatic relay and returned to its original position when this relay ceases to be energised. Two figures.

25,477/13. **Circuit Breakers.** F. B. HOLT and H. SMITH. Circuit breakers with auxiliary contacts and additional sparking tips to open after the main contacts, and connected to a resistance or reactance mounted on the member carrying the contacts. Two figures.

26,623/13. **Voltage Regulators.** A. H. OLMSTEAD. Voltage regulators in which two contacts control the insertion of a resistance in the generator field, one actuated by an electromagnet connected to the generator circuit and the other vibrated by an electromagnet energised from another source, the armature being connected by a "lost motion" movement with a pivoted lever which carries a contact and makes or breaks the circuit of the magnet. Two figures.

5,346/14. **Electric Horns.** W. W. DEAN. An electric diaphragm horn in which the natural period of the armature reed is sufficiently high for the rate of oscillation when oscillated by an electromagnet not to be influenced, so that a clear, strong note is obtained over a considerable range of frequency. Seven figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, &c.:** READ and BRANSOM [Control of electric supply] 22,348/13.

**Dynamos, Motors, and Transformers:** MORRIS, MORRIS & LISTER, LTD., and CATEAUX [Transformers] 22,394/13.

**Electrometallurgy and Electrochemistry:** DAVIES and A. GALLEN-KAMP & Co. [Resistance furnaces] 10,415/13.

**Heating and Cooking:** BASTIAN [Mounting resistances] 22,023/13.

**Incandescent Lamps:** BASTIAN [Glow lamps] 22,024/13.

**Switchgear, Fuses, and Fittings:** BRACKENSIECK [Lamp-holders] 28,915/13; GARDNER [Relay apparatus] 6,953/14; SHORT [Switch fuse] 8,456/14.

**Telephony and Telegraphy:** WESTERN ELECTRIC Co., NASH and GRACE [Lamp telephone signals] 22,405/13; BRITISH L. M. ERICSSON MANUFACTURING Co. and BROOKES [Intercommunication telephones] 13,567/13.

**Traction:** B.T.H. (G.E. Co., U.S.A.) [Electro-pneumatic brakes] 22,224/13; THOMAS TRANSMISSION, LTD., and THOMAS [Driving of road vehicles] 22,246/13.

**Miscellaneous:** MUNTZ [Selector for bells] 21,931/13; WOOLLOX [Flashing signal lamp] 24,093/13; WILSON [Electric cranes and hoists] 4,294/14; BOURSIN [Electromechanical engine starter] 10,480/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, &c.:** A. G. BROWN, BOVERI ET CIE. [Rotary converters with commutating poles] 24,337/13; SOC. ANON. DES ETAB. L. BLERIOT [Combined dynamo and accumulator system] 16,935/14 and 16,936/14.

**Meters:** LANDIS & GYR, LTD. [Prepayment meters] 20,146/14.

**Telephony:** SIEMENS & HALSKE A.G. [Grouping of subscribers' lines according to frequency of calls] 16,316/14.

The following Amended Specifications can now be obtained:—

B. HOPPS [Sparking plugs] 5,210/09; SIEMENS BROTHERS & Co., LTD. [Transmission of signals] 17,124/13.

### Applications for Suspension

13,067, 13,068, and 13,069/06. **Magnetic Clutches.** W. SCHUSTER and H. AST (Vienna). Applications for suspension of these three patents made by C. E. Lugard will be heard on November 3rd. These specifications describe improvements in magnetic clutches relating respectively to ventilating ducts, disengaging springs, and arrangement of windings.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

18,865/00. **Wireless Telegraphy.** J. A. FLEMING and MARCONI'S WIRELESS TELEGRAPH Co. This specification describes a system of producing Hertz waves in which a continuous-current dynamo controlled by a revolving contact maker is used to charge a condenser. The secondary of this condenser is connected to the aerial oscillating circuit. Two figures.

18,921/00. **Electric Furnaces.** G. BENEDICKS. Furnaces heating by means of an induced current in the material to be treated or in a conductor in contact with it, in which the inducing coil is on a central iron core surrounded by an annular heating chamber.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** VON ROHR [Reflectors for searchlights] 13,293/05.

**Dynamos, Motors and Transformers:** J. PHILLIPS [Commutator grinder] 13,142/01; CROMPTON & Co., J. C. MACFARLANE and H. BURGE [Motor converters] 15,494/09.

**Incandescent Lamps:** E. A. CAROLAN (G.E. Co., U.S.A.) [Lamp caps] 14,597/03.

**Switchgear, Fuses and Fittings:** S. G. BROUNGER and W. J. HAYWOOD [Rheostats] 14,814/03.

**Traction:** E. H. COCKSHOTT [Trolley heads] 15,147/09.

## ELECTRIC TRACTION NOTES

The interchange facilities between the Bakerloo and Metropolitan Railways at Baker Street became greatly improved last Thursday, when moving stairways, leading direct from the platforms of the latter line to the Bakerloo station beneath, superseded the existing means of connection. Passengers transferring from one railway to the other will be saved something like two minutes in making the change.

At a meeting last Friday of the Metropolitan Association of Electric Tramway Managers, Messrs. Ullmann (East Ham) and Schofield (Leyton) were re-elected Chairman and Vice-Chairman respectively, and Mr. Goodyer (Croydon) was re-elected Hon. Secretary.

The Secretary of the British Electric Traction Co. informs us that a large majority of each class of shareholders in the country, and of the income certificate holders, are in favour of the scheme for the reduction of capital. Under existing conditions, however, the Directors consider that the wisest course is to defer any further action in regard to the scheme for the present.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

On the subject of illicit wireless stations and the possibility of communicating information to Germany by their means, Dr. J. Erskine-Murray, in a letter to Monday's *Times*, says that he has before him a German technical publication describing experiments in which signals were transmitted from an aerial wholly indoors to a station over 150 miles distant. It would, he continues, be very foolish to suppose that the enemy has not taken all precautions to maintain the inland communications of his agents in this country independently of the ordinary postal telegraph system, even although such special means of communication may be reserved for communication with Zeppelins or other invading forces. Not only is it possible, he says, for anyone to use a telephone aerial wire for reception of wireless messages, but two subscribers can communicate telegraphically over an ordinary telephone, and even a trunk line, without the knowledge of the exchange operators, and without interrupting conversation on the line. Such messages, however, might be detected by a neighbouring wireless station. He suggests that the search for such illicit communications would be greatly facilitated by granting special licences to approved amateurs throughout the country, who, if thought advisable, could be sworn in as special constables, with instructions to keep day and night watch on all signals, and he offers to undertake the organisation of this service with the assistance of his colleagues of the Wireless Society.

The case of the young Hammersmith clerk who insisted on working a wireless telegraph apparatus without a licence from the Postmaster-General (*ELECTRICAL ENGINEERING*, Oct. 8th, p. 537, and Oct. 15th, p. 545) came before Mr. Justice Rowlatt at the Old Bailey last Wednesday, and ended in an unexpected manner. The Post Office decided to charge him only with having an unlicensed wireless telegraph apparatus at work in August, 1913, as they desired to take a lenient view of the case. It was explained that the boy had taken up wireless telegraphy as a hobby, with the object of fitting himself for the post of wireless telegraph operator, and that a large portion of the apparatus had been made by himself. It was not considered now that there was any ulterior motive in what the prisoner had done, nor that he had been of any help to the enemy. Mr. A. A. Campbell Swinton, as President of the London Wireless Telegraph Society, gave evidence on behalf of the defence. He said that he did not know the prisoner personally; but at the same time, in view of the facts which were now admitted on both sides, he asked that the prisoner should have every possible consideration. Mr. Justice Rowlatt said that, had it been proved that the prisoner had had his installation connected up since the commencement of war, hobby or no hobby, he would have given the fullest sentence which the law permitted, but, in the circumstances, he would impose imprisonment for two weeks, and the confiscation of the apparatus.

A sensational statement was published in the Press last Saturday and Sunday to the effect that a wireless telegraph

apparatus of long range had been seized at the house of Prof. Schuster (one of the Secretaries of the Royal Society), and to this the information was added that Prof. Schuster was born in Germany in 1851. Further inquiry, however, shows that the facts of the case were as follows:—The installation in question had been erected by Prof. Schuster under licence last June, for receiving time signals from the Eiffel Tower. When war was declared Prof. Schuster was away with the solar eclipse expedition, and the Post Office officials took down the installation and packed it in a sealed box and left it in the house, and last week the police came to remove the box. There has never been any suggestion that the installation has been used for, or was intended for, any illicit purpose.

In our last issue we published a list of some of the towns in which automatic telephone exchanges are being put in, but by a regrettable oversight we omitted to mention the three in which the equipment is most advanced. One of these is at Darlington, and has now just been opened; a description appears on another page. This equipment, it is seen, is on the Western Electric Co.'s system. Newport (Mon.) is also fairly well advanced, as is also Portsmouth; but they are still in the contractors' hands. The equipment of these will be on the Strowger system. At Leeds, also, an automatic exchange is to be installed; but it is awaiting the completion of a new building. With the opening of the Darlington exchange the Post Office will be able to compare three systems—the Strowger at Epsom, the Lorimer at Hereford, and the W.E. Co.'s at Darlington.

Our special article on "Germany's Telegraphic Isolation," in our issue of October 8th, was quoted in the *Times*, the *Morning Post*, the *Daily Graphic*, the *Globe*, the *Daily News* and *Leader*, the *Evening News*, the *Star*, the *Manchester Guardian*, the *Liverpool Daily Post*, the *Yorkshire Observer*, the *Wiltshire News*, the *Scotsman*, the *Dundee Advertiser*, the *Glasgow News*, the *Edinburgh Evening Dispatch*, the *Northern Whig*, and the *Cork Constitution*.

The first issue of the *Telegraph and Telephone Journal* has made its appearance. It is to be published monthly at the General Post Office, under the Editorship of Mr. W. H. Gunston, who was Editor of the *National Telephone Journal*, and Mr. John Lee and Mr. J. W. Wissenden act as an editing and organising committee. The journal is somewhat limited in scope, as technical engineering subjects are to be left in future to the *Post Office Electrical Engineers' Journal*.

The private telegraph service with Belgium is suspended.—The Sitka-Valdez cable was repaired on the 15th inst.—The Jupiter Inlet-Nassau cable is still down, and messages can only be sent by wireless in plain language, and subject to censorship of the United States.

**The Engineer Section of the R.N.D.**—At the meeting of the Institution of Mechanical Engineers on Friday, it was stated that up to October 10th, 500 men had enlisted in the Engineer Section of the Royal Naval Division. Three members of the Institution of Mechanical Engineers have been allotted commissions. There is also attached to the section a certain number of navvies and artisans, men whose families are dependent upon the separation allowance and such other allowances as are obtainable from the various funds, and a small committee has been appointed to see that these dependents obtain the allowances which are due to them. Two members from each of the three Institutions are on this committee, and on behalf of the Institution of Mechanical Engineers, Dr. Clark and Mr. W. H. Patchell are acting.

**Faraday House Journal.**—The current issue of this record of the doings of old and present students of Faraday House contains a list of 68 at present serving in the Allied forces, with some portraits. Of this list three are in the Flying Corps, a large number in special sections of the Royal Engineers, Army Service Corps, and Royal Naval Division, performing electrical and engineering duties. It is also recorded that three students who happened to be in Germany are detained as prisoners. Besides various interesting personal items, there are several illustrated technical notes on plant and apparatus of the companies who take students from the College.

**The International Electrical Congress, San Francisco.**—It is stated in the *Electrical World* (New York), that there is every probability that the International Electrical Congress which was to be held in San Francisco in connection with the Panama-Pacific Exhibition, will be postponed owing to the war.

**Prohibited Exports.**—An Order in Council issued on Monday prohibits the export of signalling lamps operated by electricity and capable of being used for signalling Morse or other code.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent,

draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,412.

A consumer, without notifying the supply authority, increases his load so that for one or two hours every day the load exceeds by 50 per cent. the rating of his meter. What will be the effect of such a procedure on the chief patterns of meter on the market, and what indication will the supply authority have that this has been done? It is of course assumed that the main fuses have not blown.

The replies to this question have not been of as high merit as usual, and the question is therefore repeated this week. Replies may now be sent up to *first post Thursday, October 29th*, and competitors who have already sent replies are invited to try again. The two points in question are, to what extent the 50 per cent. overload will be inaccurately recorded on the meter (and whether the error will be + or -), and if the supply authority can have any indication of the change in the load except by the fact that the amount registered is greater than usual.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### A NEW FORM OF HEATER

**A** HEATER which is designed to project beams of heat where required has great advantages in some cases of local heating. Such an apparatus has been provided by Simplex Conduits, Ltd. (Garrison Lane, Birmingham), and is illustrated here. The heating element is a coil of special non-oxidisable ribbon wound on a reinforced tube which is raised

THE PLEXSIM HEAT PROJECTOR.

to a red-heat. This glowing bar is laid along the axis of the polished copper conical reflector, by which the heat is projected in the required direction. The guard is open, so that it does not baffle the heat, and it is possible to dust the reflector without removing the guard. The element is supported at both ends and cannot sag, and the connector-box is strong and well ventilated.

### CALOR HEATING AND COOKING APPLIANCES

**T**HE latest designs of the Calor electric fire and other heating and cooking appliances are illustrated in a pair of new leaflets which Townshend's Art Metal Co., Ltd. (Ernest Street, Holloway Road, Birmingham), have prepared for overprinting with contractors' names and addresses. We are informed that considerable improvements have been made in the Calor fire with its glowing disc heating element, particularly in the strengthening of the element itself and the

simplification of the method of its replacement. These fires are installed on several British warships. The other heating and cooking apparatus includes several novelties, including an electric steamer in several sections, useful forms of immersion heater, and the boiling plate shown in Fig. 1. This is fitted with the same patented element as used in the fires, consisting of nichrome wound on a special clay base which can be

FIG. 1.—GLOWING HOT-PLATE. FIG. 2.—ELECTRIC COFFEE POT.

run at a dull red heat. It is very durable and is put on the market at a remarkably low price. Among other items we notice particularly the very practical-looking coffee pot shown in Fig. 2. Other apparatus comprises kettles, irons, toasters, hot-plates, grillers, &c.

**German Trade in Aluminium.**—The Board of Trade has issued a pamphlet with some statistics of the exports from Germany and Austria-Hungary of aluminium and aluminium wares to different countries. The total value of Germany's aluminium export in 1912 was £456,800. Particulars are also given of the markets in various parts of the world for aluminium wares. Copies of the pamphlet, with more detailed information, can be obtained from the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

**A Directory of British Manufacturers for Russian Trade.**—With a view to assisting in the transfer of trade with Russia hitherto supplied by Germany, to British manufacturers, Mr. R. A. Lenski (114 Fenchurch Street, E.C.), has undertaken the preparation of a directory of British manufacturers under trade headings in the Russian language, and is inviting the co-operation of British manufacturing firms in the matter.

### DRYING TRANSFORMER OIL

IN view of the very great effect on the dielectric strength of transformer oil of even minute percentages of water, and the otherwise deleterious effects of sediment and impurities, the British Thomson-Houston Co. has developed the special apparatus illustrated here for freeing the oil from water, slime, and sediment by forcing it under pressure through several layers of dry blotting paper in a specially designed filter press. The oil is pumped under a pressure of from 25 to 100 lb. per sq. in. through a series of sheets of soft, dry, white blotting paper of special make. Most of the solid matter is caught in the first layer of paper, while the water is retained on account of the capillary attraction between paper and water being greater than between paper and oil. The paper is dried again after use in a special electric oven. The sheets of paper are supported on ingeniously arranged cast-iron plates with grooved surfaces. A large number of

DRYING AND FILTERING APPARATUS FOR TRANSFORMER OIL.

sheets are used, giving considerable filtering surface. Various styles of pump are used, according to the size of the equipment. The 12-in. 20-chamber size, with 30 sq. ft. of filtering surface, illustrated here, has a specially designed three-stage centrifugal pump, driven by a 7.5-h.p. motor, and passes 30 gallons per minute. An equipment of this size is in use by the Glasgow Corporation Tramways. When it was first adopted, transformer oil which had been in use for ten years was passed through the filter and tested with electrodes 0.05 in. apart. Before filtering, it broke down at 1,500 volts, but after once filtering required 10,200 volts for breakdown, and after twice filtering withstood 20,000 without breaking down. Another piece of apparatus is combined motor-driven fan and electric air-heater for driving a current of heated air through transformers, to dry them out thoroughly before filling them with oil, a matter of equal importance to the drying of the oil itself.

### THE ENEMY'S TRADE

IN connection with the campaign undertaken by the Board of Trade, on the advice of their Advisory Committee on Commercial Intelligence, to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board have received a very large number of inquiries for names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war.

Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with the inquiries, and lists are being prepared and circulated of articles which inquirers desire (a) to purchase and (b) to sell. The first and second lists were published on August 29th and September 18th respectively; the third list, in which is incorporated the first and second lists, is now ready, and may be obtained on application to the Branch. Firms

interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch, Board of Trade, 73 Basinghall Street, London, E.C.

The list of articles which the inquirers desired to purchase includes:—Beads for lampshades, bitumen and cases for flash-lamps, presspahn, celluloid battery cases for miners' lamps, china for electric fittings, clockwork mechanism for electrical apparatus, and the following electrical apparatus:—Accessories, accumulators, batteries for pocket flash-lamps, bells and pushers, brass caps for flash lamps, vulcanised rubber cables, carbon brushes for switches, carbons, celluloid cases, conduits and fittings, corrugated iron cases for transformers, dry cells, dynamos and motors for cars, illuminated signs, insulating links for switches, lamp sockets, magnetos, novelties, *papier maché* covers, plates and rods for batteries, sparking plugs, telegraphic and telephonic switches, vulcanite mouldings, zinc cells, glass-ware for arc lamps, fittings and accumulator boxes, jewels for electrical instruments, electric fans and heaters, lampshades, metal filament and arc lamps, pocket lamps, lamp-holders, lightning conductors, electric automatic machines, lamp-making machinery, magnets, copper, sheets for armature stampings, reflectors, mica, tungsten, molybdenite, insulating varnish, Roentgen-ray bulbs, spun silk for covering electric wires, non-magnetic watch springs, diamond dies for wire drawing.

The list of articles which inquirers desire to sell includes aluminium, electrical apparatus, magnets, mica, and tungsten.

The list of goods which firms abroad are open to purchase includes cables, electrical apparatus, accessories, fittings, and machinery.

Lord Lytton kindly offers to provide free sites for workshops at the Garden Village, Knebworth, Herts, 25 miles from London, for the production of articles hitherto imported from Germany. Applications should be made to Messrs. Pepler & Allen, 4 Arundel Street, Strand, W.C.

### A QUESTION OF PRINCIPLE

IN the City of London Court last week, before Judge Atherley Jones, K.C., the Armorduct Manufacturing Co., Ltd., sued Messrs. H. Defries & Co., electrical engineers, 59 New Oxford Street, for £1 10s. 6d. for trade goods supplied. Although involving so small an amount, the case is somewhat important as bearing upon the rights of a German-owned firm, trading in England as an English limited liability company, to recover debts during the period of war. Messrs. Defries & Co. did not dispute owing the amount; indeed, already £20 on account had been paid, but the balance of £1 10s. 6d. was refused on the ground that the plaintiffs are a German company, and consequently alien enemies. It was stated that the Armorduct Co. was registered eight years ago with an authorised capital of £15,000 in £5 ordinary shares and £1 preference shares. Three English shareholders hold 380 shares, and the balance of 1,435 shares was held by Germans. [According to a recent article in the *Evening News*, the total capital issued is £6,651, of which £5,232 is held by residents in Germany.] The managing director, Mr. W. Schmahl, is a naturalised German. This information was given by the English secretary of the company, whom the judge said seemed to have "fallen among Germans." In giving his judgment against the Armorduct Co., the judge said that the English Courts could not be used for the purpose of ministering sustenance to the enemy in matters of this description. The internal affairs of the Armorduct Co. showed that the profits would all go to Germany. The defendant, he added, had honestly discharged his obligation to this country. Leave to appeal was granted, it being stated by counsel for the Armorduct Company that, if the company could not collect its debts, 200 British workpeople would lose their employment.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**AUTOMATIC CIRCUIT-BREAKERS.**—A new illustrated pamphlet from the British Thomson-Houston Co. gives full illustrated particulars and prices of the Company's latest designs of automatic circuit-breakers for alternating and continuous currents with laminated edgewise main contacts, auxiliary copper and carbon breaking contacts, and free handle tripping device. The tripping mechanism is simple and strong, and can be actuated in a variety of ways, such as overloads, reverse current, low voltage, &c., with or without time limit arrangement. These breakers are listed up to 4,000 amperes in a number of forms; single, double, and triple pole; front or back connected.

**OZONE.**—A pamphlet from Ozonair, Ltd. (96 Victoria Street, S.W.), entitled, "All About Ozonair," gives an interesting survey of the properties and production of Ozone, and its commercial applications for air purification as embodied in the Ozonair system of ventilation, for deodorisation, in therapeutics, for water purification, sewage treatment, and food preservation, as well as in the brewing, bleaching, chemical, textile, and other industries.

**WATER STERILISATION.**—A complete apparatus for sterilising water by the action of ultra-violet rays produced by quartz mercury vapour lamps is described in a leaflet from the Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.). The equipment, which is made in several sizes up to 130 gallons per hour, is suitable for domestic or hospital purposes.

**METAL FILAMENT LAMPS.**—A very effective showcard, issued by the Edison & Swan United Electric Light Co., Ltd. (Ponders End), decorated with Union Jacks, and entitled "Keep the Flag Flying," calls attention to the British origin of Royal Ediswan Lamps.

**HEATERS.**—An illustrated pamphlet from the British Thomson-Houston Co., Ltd. (Rugby) deals with several patterns of heaters. These include a number of designs of radiant "fires" with glowing wire elements as well as non-luminous convectors suitable for a variety of conditions.

**STORAGE BATTERIES.**—The latest pattern of "Ironclad Exide" battery, which is now largely used for electric vehicle work, is described in an illustrated pamphlet from the Chloride Electrical Storage Co., Ltd. (Clifton Junction, Manchester).

**LAMPS.**—An effective "poster stamp," repeating in miniature their well-known Union Jack Mazda advertisement, has been prepared by the British Thomson-Houston Co., for issue in quantities to contractors.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Ashton-under-Lyne.**—A report is being prepared dealing with extensions at the generating station.

**Blackpool.**—H. and L.T. cable, distribution pillars, and conduit. Borough Electrical Engineer.

Water-tube boiler, mechanical stokers, 1,500-kw. alternator, &c. Borough Electrical Engineer. Nov. 19th. (See an advertisement on another page.)

**Connah's Quay.**—Complete generating equipment, including gas engines, generators, battery, mains, services, public lighting, &c. Consulting Engineers, A. J. Leigh & Partners, Bank Chambers, Northwich. Nov. 6th.

**Heywood.**—Converting plant. Borough Electrical Engineer.

**Ireland.**—The Great Northern Railway Co. of Ireland requires a twelve months' supply of electric cable and wire, electrical fittings, &c. Secretary, Nov. 5th.

**Keighley.**—Extensions to electricity works (£1,000).

**London: Hammersmith.**—H.T. and L.T. cables. Borough Electrical Engineer. Nov. 4th. (See an advertisement on another page.)

**Pontypridd.**—1,800 yards of 0.4 concentric paper-insulated and lead-covered cable. Borough Electrical Engineer. Oct. 20th.

**Tunbridge Wells.**—H. and L.T. cables. Borough Electrical Engineer. Nov. 7th.

**Turton.**—Extensions at power station (£3,815).

**Waterford.**—The electric lighting scheme, at an estimated cost of £30,000, is to be proceeded with.

### Wiring

**Cardiff.**—Wiring and fitting of County police station. Clerk, County Council. Oct. 26th.

**London: L.C.C.**—235 wiring points with 290 lights at Senior St. Elementary School, Paddington. (See an advertisement on another page.)

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Altrincham.**—Extensions to Stamford Park school (£2,000).

**Bradford.**—New infirmary (£100,000).

**Coatbridge.**—Extensions to Technical School and Mining College (£7,000).

**Hull.**—Housing scheme (£100,000).

**Ipswich.**—Hospital, Foxhall Heath. Borough Engineer.

**Leicester.**—Extensions at North Evington Infirmary (£20,000).

**Leigh (Lancs.).**—Additions to workhouse (£9,000).

**Manchester.**—Carnegie Library, Didsbury. City Architect. October 16th.

**Nottingham.**—Four new branch libraries.

**Rawtenstall.**—New Post Office, and telephone exchange.

**Sal.**—School (£5,000).

### Miscellaneous

**Birmingham.**—Tramway extensions (£111,240).

**Dublin.**—The Dublin United Tramways Co. requires a twelve months' supply of electrical stores. Chairman, Nov. 9th. (See advertisement on another page.)

**Swinton and Pendlebury.**—Street-lighting equipment. Borough Electrical Engineer.

## TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Chesterfield.**—The following tenders have been placed:—British Westinghouse Co., for a 1,500-kw. rotary-converter and transformer, with switchgear, at £2,200, and a 1,200-kw. transformer and switchgear at £282; British Insulated & Helsby Cables, for high-tension cable at £725.

**Eccles.**—The tender of Messrs. E. Bennis & Co. has been accepted for a coal elevator and conveyor.

**Gillingham.**—A contract has been placed with the British Electric Transformer Co. for five transformers, subject to inquiries to ascertain whether the Company is a purely British concern.

**London: St. Pancras.**—The tender of Medway's Safety Lift Co. for an electro-oil lift at the King's Road Station has been accepted at £1,169 plus £200 for a spare motor-driven oil pump.—A tender of the British Niclausse Boiler Co. was recently accepted for four boilers at the King's Road Generating Station at £20,200; a difficulty has now arisen as to the steel supporting work of the chimneys for the boilers. The Company state that this was not included in their quotation, and informs the Chief Electrical Engineer that they will not go on with the contract unless the cost of this steelwork, viz., £700, was added. The Committee recommends that the Company's suggestion be adopted.

**Salford.**—The tender of Messrs. Willans & Robinson for a 5,000-kw. turbo-alternator with surface-condensing plant.

## APPOINTMENTS AND PERSONAL NOTES

We regret to announce the death, from gastritis, of Mr. Gordon Stuart, the popular Secretary of the Stearn Electric Lamp Co., Ltd. Mr. Stuart is succeeded by Mr. H. W. Cole, who has acted as Mr. Stuart's Chief Assistant for many years.

The Gillingham Electricity Department requires a shift engineer. Salary 32s. 6d. rising to 40s. per week. Applications to Borough Electrical Engineer.

A testing assistant is required in the York Corporation Electricity Department. Applications to City Electrical Engineer.

Mr. W. T. Le Feuvre, Borough Electrical Engineer at Bexhill, having applied for a Commission in the Army, the Council has decided to keep his post open, and to pay his family £225 per annum, retaining the remaining £200 per annum for the payment to the Assistant Engineer of an additional £100 per annum, the balance to meet any further engineering assistance that may be required.

The following is the short list of applicants for the position of Generating Engineer at the Hackney Electricity Works. Commencing salary, £120 rising by annual increments of £7 10s. to £150: H. Kraseman, Assistant Charge Engineer, Hackney; F. D. Osborn, Assistant Shift Engineer, Hackney; and D. H. Rogers, Assistant Shift Engineer, Hackney.

## LOCAL NOTES

**Bury St. Edmunds: Arc Lamp Carbons.**—A further reduction in the hours of lighting the public arcs has been decided upon, as the stock of carbons under ordinary conditions would only last twelve weeks, and the Electrical Engineer reports that he can only obtain further supplies at exorbitant prices. Meanwhile, consideration is to be given to the substitution of arc lamps by high candle-power metal-filament lamps.

**Carshalton: Bulk Supply.**—The Council has decided to withdraw its objection to the proposal of the County of London Electric Supply Co. to give a supply of electricity in bulk to the South Metropolitan Electric Tramways and Lighting Co.

**Edinburgh: Street Lighting Charges.**—With reference to the note in our last issue concerning the reduction in the hours of burning public arc lamps, it has now been arranged that in view of this reduction the rate for all-night lamps shall be increased to £9 16s. 8d., and for half-night lamps to £5 3s. 8d.

**Hessle: Electric Supply.**—Various schemes for giving a supply of electricity in the Hessle district have been under consideration for several years, but none have yet been carried out. The intention of the Council has been to obtain a supply from one of the neighbouring towns, and it has now been decided that the Hull Corporation shall apply for an electric lighting Provisional Order.

**Leeds: Management of Electricity Undertaking.**—The question of appointing a special committee to deal with the electricity undertaking, instead of both this and the Tramways Department being under one Committee, as at present, was raised at the last meeting of the Corporation. It was decided, however, to leave the matter over for the new Council, which will be appointed in November, to deal with. There has been a growing feeling of late that the management of the Electricity Department should be reconsidered.

**London: Hackney: Lamp Trimmer Killed at Front.**—The Electricity Committee recommends that a sum of £10 be paid to the widow of J. Singer, late arc-lamp trimmer in the Department, who was drowned in the disaster to *H.M.S. Hogue* in the North Sea. In addition, £4 13s. 11d. is to be paid to the workman's widow, this being the amount he had paid in the Superannuation Fund.

**Maidstone: Engineer's Bonus.**—According to the *Kent Messenger*, the Council has decided to ask the Electrical Engineer to refund any bonus received by him for the past year in excess of the £500 limit fixed in 1910. In that year it was arranged that Mr. Hoadley's salary should be £300 per annum, plus a bonus on a certain scale, the total not to exceed £500. Apparently, however, Mr. Hoadley was paid a total salary of £700 in the year 1913-14.

**Oldham: Electric Supply Extension.**—In response to requests from the Lees and Springhead Councils for a supply of electricity, the Electricity Committee is to meet a deputation with a view to endeavouring to arrange terms.

**Pickering: Electric Light Scheme Postponed.**—The promoters of the local electric lighting Order have asked the Council to leave unsigned, for the present, the proposed agreement. The reason for this request is the unsettled condition of the money market; but it is anticipated that a scheme will be submitted in about six months' time.

**Walsall: Supply of Electrical Fittings.**—The Electricity Committee has decided to open a showroom in order to supply electrical fittings to the public.

MISCELLANEOUS BUSINESS NOTES AND  
TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, the following may be taken as the official quotation for electrolytic copper bars, viz., £52 10s. to £53. (Last week, £55 to £55 10s.)

**Companies Struck Off Register.**—The names of the following will be struck off the register of joint stock companies in three months unless cause is shown to the contrary:—Bishop's Stortford and Stansted Electric Lighting Co., Ltd.; British Electric Light Wiring Co., Ltd.; British Ever-Ready Electrical Co., Ltd.

COMPANIES' DIVIDENDS, REPORTS,  
MEETINGS, &c.

**Drake & Gorham.**—Including the sum of £1,716 brought forward from the previous year, there is a sum available for the year to June 30th, 1914, of £9,931. A 4 per cent. dividend is recommended, goodwill is written down by £3,000, and a balance of £1,931 carried forward. The directors have not deferred the payment of dividends, as they appreciate the necessity for maintaining the circulation of money. Mr. B. M. Drake presided at the annual meeting last week. He pointed out that although the net profit is somewhat lower than last year, it is practically the same as the average for the past three years. The difference is caused by additional expenditure upon advertisements, including catalogues, and partly to a decreasing turnover in the North due, doubtless, to the condition of the cotton trade. The Company has acquired a sole agency for Lancashire and Cheshire, and a general agency elsewhere for commercial vehicles propelled by Edison batteries.

**Dick, Kerr & Co.**—The net profit for the year to June 30th was £44,761, compared with £30,092 in the previous twelve months. Adding the balance brought forward, the available total is £55,086. After meeting debenture interest and preference dividend, the balance is £25,525, which it is recommended should be carried forward. The directors do not propose any dividend on the ordinary shares in view of possible contingencies resulting from the war. It is also proposed to utilise the reserve of £150,000 to adjust the values of investments and assets generally, and the necessity for more working capital (to meet the increase in business indicated owing to diminution of German competition) requires an issue of debentures.

At the annual meeting on Thursday, Mr. Claud T. Cayley, the Chairman, expressed the opinion that however Germany might be crippled financially for the time being by the war, she would make stupendous efforts to regain her lost markets.

## SUMMARY

WE report an action in the Chancery Division relating to an alleged infringement of a patent for a conduit grip fitting (p. 560).

ALTHOUGH Canada has hitherto imported considerable quantities of bulbs and complete metal filament lamps from Germany, a certain number of lamps are manufactured there and no shortage is expected (p. 560).

AN article on the carbon industry appears on p. 560.

SOME remarkable figures for steam consumption have been obtained on tests of a 1,000 kw. Ljungström steam turbine at St. Pancras (p. 561).

THIRTY-EIGHT 750-watt half-watt lamps have been fixed in Oxford Street, Manchester (p. 561).

THE relative advantages of lap and wave armature windings are discussed in our "Questions and Answers" columns (p. 562).

THE new edition of "Lektrik Lighting Connections" is reviewed (p. 563).

FAULTS upon tramcar magnetic brakes are referred to.—The Brighton Corporation refuses to adopt the over-running type of trolley omnibus favoured by Hove (p. 563).

THE equipment of an American wireless station able to communicate with Germany is described (p. 563).

Two patent specifications by C. O. Bastian for mounting heater resistances and drawn wire helical lamp filaments were published last Thursday. Other interesting specifications include a system of opening accumulator charging circuits automatically on full charge and improvements in lampholders, switches,

and hooters. Among the patents expiring this week, after a full life of fourteen years, are the Mansbridge condenser patent, one of the B.T.-H. Co.'s multiple unit control patents, and a patent in connection with the Lorrain surface contact system (p. 564).

AN interesting system of automatic motor control and a new high-tension fuse are described in our Trade Section, which also calls attention to new wall plugs and adapters, new fittings for half-watt lamps, and a system of shop window lighting (pp. 564 to 566).

AN expenditure of £25,000 on plant and mains is contemplated at Southport; mains are required at Hastings; new generating plant by Melbourne and River Plate Electric Supply Co.; hand lamps by H.M. Office of Works; and a works is to be equipped electrically at Oldham (p. 567).

THE Bradford contract for the 5,000 kw. Bergmann turbo-alternators is referred to.—Considerable objection is shown in Croydon to the L.C.C. power scheme.—The Basingstoke Diesel engine power station has been opened (p. 568).

## THE INSTITUTION 1914-15 SESSION

AS already announced, the Institution of Electrical Engineers will open its 1914-15 Session to-day (Thursday), when the President, Sir John Snell, will deliver his Inaugural Address. The papers which are to be read during the first part of the session were announced in our last issue. At the opening meeting of the Manchester Section at the Engineers' Club on Tuesday, Mr. P. P. Wheelwright, who was elected Chairman on the resignation of Dr. Rosenberg, will deliver his address. On Nov. 17th, Dec. 1st, and Dec. 15th, the papers to be read in London by Mr. Beaver on "Cables," Mr. Selvey on "Power Plant Testing," and Mr. Wedmore on "Automatic Protective Switchgear for Alternating Current Systems," on Nov. 12th and 26th, and Dec. 10th, respectively, will be taken. On Jan. 12th, 1915, Prof. E. W. Marchant will read a paper on "Conditions affecting the Variation in Strength of Wireless Signals," and on Jan. 26th a paper on "Electric Furnaces" will be given by Mr. T. D. Robertson. Papers on the following subjects will be read later:—"Some Difficulties of High-speed Generator Design," "The Predetermination of the Performance of Dynamo-electric Machines," "Illumination," "Frequency Changes," "Training for the Industrial Side of Engineering."

The arrangements for the Yorkshire Section only go as far as the first half of the Session. The Chairman, Mr. T. Roles (Chief Electrical Engineer, Bradford), will deliver his Address on Nov. 4th, and on Dec. 2nd and Jan. 13th the papers by Mr. Selvey and Mr. Wedmore, respectively, will be taken.

For the Scottish Section, the full programme has been arranged. On Nov. 10th the Chairman, Mr. James Lowson, will deliver his Address, and the following papers are down for consideration:—Dec. 8th, "The Magnetisation of Iron at High Flux Density with Alternating Currents," by J. S. Nicholson; Jan. 12th, Mr. Beaver's paper; Feb. 9th, "Distribution and Rise of Temperature in Field Coils," by Prof. Magnus Maclean, D. J. M'Kellar, and R. S. Begg; March 9th, Mr. Wedmore's paper; April 13th, Mr. Selvey's paper. The Students' Section will not hold any meetings this Session.

The Western Section has decided to hold no meetings during the 1914-15 Session.

For "Arrangements for the Week," see page 568.

## A GRIP CONDUIT FITTING PATENT ACTION

IN the Chancery Division on Friday of last week and Monday of this week, Mr. Justice Joyce heard an action for alleged infringement of Patent No. 18,375/05, which relates to a grip conduit fitting. The patent is owned by the Walsall Hardware Manufacturing Co., and the defendants were the Stella Conduit Co., Ltd., of Bilston, Staffs. Mr. A. J. Walter, K.C., Mr. H. A. Colefax, K.C., and Sir Denham Warmington appeared for the defendants, whilst the Stella Conduit Co. was represented by Mr. T. Terrell, K.C., and Mr. A. Grey.

The illustration below, reproduced from the patent specification in question, shows a conduit coupling with a longitudinal split, at the end of which is a cross cut, in order to allow of elasticity in the coupling, there being also lugs as a means of tightening the couplings on to tubes. The defendants admitted that they manufacture their conduit fittings exactly in accordance with the patent, but alleged that there was no subject-matter for the invention. The main point relied upon by them was that a coupling with a longitudinal split and cross cut, with lugs for tightening as a means of holding tubes together has been in use in connection with the "heads" of bicycles from the very earliest days, and that all that had

been done under the patent was to apply such a means of fastening to various forms of bends, T-pieces, sockets, &c., in order to enable a perfect grip to be obtained of tubes used as electrical conduits.

On the other hand, Mr. Walter, whilst admitting, after the case had proceeded a little while, that the patentee had adopted the familiar bicycle head coupling as the basis of his invention, urged that the fact that he had applied it at two ends of a coupling, instead of only at one, as in the case of a bicycle, constituted invention. In addition to this, he argued that the main object of the invention was to secure electrical continuity, and that this had been achieved was admitted by the defendants in their catalogue, which referred to this form of grip fitting as the best, most reliable, and cheapest form of grip fitting on the market from the point of view of electrical continuity. He did not suggest that the patent invented a new form of pipe grip, but argued that it was a patent of selection in the sense that a form of grip had been selected as the best for the purpose, and dealt with in such a manner that a combination was obtained giving a result which the separate parts did not give before.

Mr. James Swinburne, F.R.S., gave expert evidence for the patentees, and Mr. E. C. R. Marks (Messrs. Marks and Clerk) and Mr. N. Rosher, of Messrs. Moffet and Rosher, were the chief witnesses for the defendants.

Judgment was reserved.

## THE LAMP SITUATION IN CANADA

AN article in the (Canadian) *Electrical News* reviews the effect of the war on incandescent lamp supply in Canada, and to some extent North America, generally, and states that the danger of shortage appears remote. It seems, however, that up to now lamp manufacturers of North America have, like ourselves, relied largely on Germany and Austria for bulbs, although at least one lamp factory in the United States already blows practically all its own bulbs, and the practice is increasing. The lamp caps have hitherto chiefly come from Holland, as is the case here. A large percentage of the metal-filament lamps used in Canada have been, and are still, coming from England and Holland, and there is no likelihood of any marked increase in price. A prominent Canadian manufacturer states that, after difficulties in starting his own bulb blowing, he has been buying bulbs from the United States at a higher price than charged for foreign bulbs. Supplies of tungsten are plentiful, and he does his own refining and wire drawing. This particular work is being much increased to meet the demand for lamps to replace those formerly imported. Some statistics are given showing that the values of metallic elements and tungsten acid imported by Canadian manufacturers for use in their own factories for making metal-filaments for the year ended March, 1914, was £350 from Austria-Hungary, £6 from Great Britain, and £883 from the United States. The figures given for

imported glass include glass used in the gas-lamp industry. The number of complete lamps imported from Germany alone was 502,533 metal-filament lamps, 296,535 carbon lamps, and 164 arc lamps. It is also of interest to give the following values of Canadian imports of arc-lamp carbons during the same period:—Austria-Hungary, £117; Belgium, £44; France, £127; Germany, £8,662; Switzerland, £498; Great Britain, £1,049; United States, £7,743.

## THE CARBON INDUSTRY

THE last leaflet which the Commercial Intelligence Department of the Board of Trade has issued in the series relating to the competition of Germany and Austria in neutral markets, deals with carbons for electric lighting, &c. Apparently the Board of Trade has not realised that conditions were prevailing which enabled Germany and Austria to supply carbons for the British market at prices far lower than those at which they could be manufactured here with profit. As the carbon manufacturers fear that these conditions may prevail again, or, at all events, in a form only modified to a certain extent after the war, there is a decided disinclination to make large extensions of carbon works on a permanent basis in this country, or to establish new ones.

As already mentioned in our issue of Aug. 13th, nearly £500,000 worth of carbons were exported from Germany during 1913, over one-sixth of which was sold in Great Britain. From Austria-Hungary £48,000 worth were exported, of which, however, £21,500 worth were sent to Germany, leaving £26,500 exported to other countries, of which £9,200 went to Great Britain. So long as it is still impossible to manufacture in this country sufficient carbons for our own needs, it does not seem likely that we shall start competing in foreign markets, unless, on further examination, the manufacturers here come to the conclusion that the increased production will put them in a position to compete with Germany for the export trade after the war is over. If the Board of Trade—possibly in conjunction with the Home Office—were to institute a detailed analysis of the reason for carbon manufacture being so much dearer here than abroad, and to suggest remedies, some useful result might be obtained.

We hear that the Silvertown Co. and Siemens Bros. & Co. are already starting the resumption of carbon manufacture which was abandoned by them years ago, and it will be interesting to see how their products and prices compare with those to which we have been accustomed in recent years. It is also rumoured that another small and independent carbon factory is being started. We welcome this activity and trust that it will assist to improve the position.

**Continental Trading Methods.**—During a discussion at the Institution of Automobile Engineers on the 14th inst., upon the steps to be taken to wrest from Germany the important share that country has acquired in the automobile industry. Mr. G. H. Baillie, a one-time partner of Mr. James Swinburne, F.R.S., mentioned that he worked in Italy on electrical work for five years. When he went there he knew a fair amount about English electrical plant, but he knew nothing about German or Swiss. Consequently he had every reason, and certainly always wished to use English plant, but the whole time he was there—and he bought a great deal of plant—he found it impracticable to buy British plant. Everything came from Switzerland or Germany. The reason was that the English seller, at any rate for comparatively small orders, would not give any facilities at all to a purchaser. It was quite impossible to get a single quotation except f.o.b. London, and in one case the cost of shipping and customs amounted to about 60 per cent. of the value of the goods. Any Swiss or German firm would generally quote free at the local station, without even being asked, or at any rate would quote at the frontier station where it was easy to ascertain the charges. No English firm also would supply except with cash against bill of lading, i.e., against cash a long time before the customer got the goods. In every case a German or Swiss firm offered very good credit terms. The English manufacturer's excuse was that the risk was too great to give credit. Nevertheless the German and Swiss firms took the risks, and also precautions against them. On these points, concluded Mr. Baillie, English manufacturers will have to mend their ways if they want to capture from the Germans the business which it is now hoped to acquire from them.

**B.E.A.M.A. Annual Dinner.**—The Council of the British Electrical and Allied Manufacturers' Association decided at the last meeting not to hold the usual annual dinner this session.

## STEAM CONSUMPTION TESTS OF A LJUNGSTRÖM TURBINE

SOME very satisfactory figures of steam consumptions which have been obtained from tests of the 1,000 kw. Ljungström steam turbo-alternator recently installed by the Brush Electrical Engineering Co. at the St. Pancras Electricity Works are given in a report by Mr. S. W. Baynes, Chief Electrical Engineer to the St. Pancras Borough Council. The set was put into commission on July 30th, and over the period of its operation has generated near a million units. The steam consumptions realised on test were considerably better than those guaranteed as is shown by the figures given below:—

Steam consumption in lbs. per kw.	Full Load.	$\frac{2}{3}$ Load.	$\frac{1}{2}$ Load.	$\frac{1}{4}$ Load.
Actual ... ..	12.75	13.57	14.67	17.76
Guaranteed ... ..	14.0	14.75	16.5	19.75

Mr. Baynes' report continues as follows:—

Since this turbine has been in use there is a saving in coal equivalent to about £1,700 per annum, a result

the 12.75 of the Ljungström set mentioned above, while 11.8 lbs. per kw. hour is guaranteed for the 5,000 which is to be installed, and it is hoped that this will be improved upon when the tests come to be made. The improvement to the fractional loads is even more remarkable.

The Ljungström turbine was developed by the brothers B. and F. Ljungström of Stockholm and is in principle a reaction machine, although differing in construction radically from any other design. Briefly, it is a radial-flow machine, in which the steam is admitted between two discs, and in its passage it passes between concentric blading rings, carried alternately by the two discs. The two discs revolve in opposite directions, and to the shaft of each is attached a generator. Notwithstanding the fact that two generators are employed, however, the complete set is extraordinarily compact for its output. There is no blading carried on split cast-iron casings, for it is all mounted on the concentric rings. This construction avoids risk of distortion when high superheats are adopted. The turbine is supported principally on the lower part of its casing, forming its exhaust branch, and can be mounted direct on the condenser without requiring separate foundations. The steam is led in by pipes within

VIEW LOOKING DOWN UPON TURBINE WITH UPPER HALF OF CASE AND DIFFUSER REMOVED.

which amply justifies the trouble and small expense of the early investigations into its merits. Notwithstanding the high speed of 3,000 revolutions per minute and 6,000 per minute between the two rotating elements there is almost complete absence of noise or vibration, and the control, both electrically and mechanically, is all that could be desired. It is, indeed, the quietest and smoothest running set ever placed in the works.

The report concludes with some interesting figures showing the progressive improvement in steam consumption there has been with the various types of plant installed in the station since its inception in 1891. Thus, while the full load consumption of the reciprocating plant improved from 26.6 to 19.5 lbs. per kw. on full load, the first kw. D.C. turbo-generator in 1906 gave a figure of 17.0 which was lowered to 16.15 by the 2,200 kw. turbo-alternator of 1909. Now we have

the lower part of the casing to chambers on either side of the discs, whence it passes through holes in them to the central annular space within the discs. It then passes radially through the gradually widening blading, leaving through a diffuser of multicellular construction and similarly widening channels and passing into the surrounding exhaust space. Labyrinth packing is provided at the shafts and between the revolving discs and the side discs, and the constructional details are of remarkable ingenuity, especially as regards the building up to the cages of blades, and their flexible attachment at alternate ends to the revolving discs. The most complete precautions have been adopted to avoid distortion from temperature effects. An idea of the relative proportions of a complete 1,000-kw. Brush-Ljungström turbo-generator will be obtained from the photograph reproduced in the figure. Summing up the general features, it may be said that the great economy obtained is due to the high relative blade speed, the small internal leakage, and the care taken to minimise radiation and other losses.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,414.

What are the relative advantages and disadvantages of using tin as against solder for the joints of high-speed (turbo driven) direct-current armatures? What is the "life" of such a joint, and how does it eventually fail? What are the usual precautions to ensure that "fatigue" of these joints does not occur from the stress reversal and temperature effects? Has any form of welded joint been used, and is this found to be successful?—"E. P. H."

(Replies must be received not later than first post Thursday, Nov. 5th.)

### ANSWERS TO No. 1,413.

In what circumstances is it preferable to employ a wave winding rather than a lap winding for the armature of a four-pole motor?

The first award (10s.) is made to "KOIL" for the following reply:—

In direct-current armatures the number of bars equals

$$\left( \frac{\text{Back e.m.f. (volts)} \times 10^4}{\text{Armature flux per pair of poles} \times \text{revs. per min.} \times K} \right)$$

where  $K$  = the number of poles divided by the number of parallel paths, i.e., 1 for all lap-wound armatures and 2 for four-pole wave-wound armatures. Thus, other things being equal, the bars in a wave armature are to those in a lap armature as 1 is to 2. The number of bars obtained with high-voltage lap-wound four-pole machines necessitates either a large number of commutator segments or numerous turns per coil. The former of these is often impracticable, owing to mechanical considerations, and the latter is undesirable, owing to the increase in reactance voltage. This voltage is proportional to the armature current per path and to the (turns per coil)<sup>2</sup>. Although with lap winding the current per path is only one quarter of the total armature current, the reactance is approximately twice as great as in a wave-wound armature with half the turns per coil, in spite of the current per path in this case being 50 per cent. of the total armature current. Thus it is always desirable to adopt wave-windings for machines above 400 volts, and more often than not above 200 volts. On lower voltages, if a single turn lap-winding gives a suitable number of commutator segments, it can be used with advantage; but, providing the sparking criteria are satisfactory, the following further considerations might still warrant a wave-winding, provided, of course, the number of commutator parts obtained with it are not too few. Lap-wound armatures must always be very carefully set in their magnets to ensure as far as possible equal magnetic loading per pole. Even then inequalities of the steel or iron of the magnet, wearing of the bearings, &c., may disturb the equilibrium and cause circulating currents to set up within the armature. Equalising connections can, of course, be fitted to overcome this trouble, but the expense and difficulty of fitting them is hardly ever warranted in small four-pole machines. Wave windings do not suffer from this trouble, and with them

the same accuracy of setting, &c., are not necessary. Again, other things being satisfactory, only two sets of brushes need be used on wave-wound armatures with consequent reduction in manufacturing costs, &c., whereas a lap-wound armature must always have as many sets of brushes as there are poles. This point is of great importance in motors for use in confined positions, such as on tramcars, where it is often most difficult to get at brushes on the lower side of the commutator for inspection, &c. To sum up, wave-windings should be used on all four-pole machines unless the number of commutator bars obtained by using them is too small.

The second award (5s.) is given to "ASTATIC," who writes as follows:—

It is preferable to employ a wave-winding to a lap-winding for armatures of four-pole motors in circumstances where the supply voltage is high (say up to 600 volts), and where, should a fault occur on the armature or brush gear, it is necessary to adopt temporary measures to get the motor running again pending a suitable time to repair the fault permanently. Lap-wound armatures do not meet these requirements in four-pole machines, and to explain this it is necessary to describe briefly the circuits in lap- and wave-wound armatures respectively. All lap-wound armatures must have the same number of brush bars as there are poles in the field magnets; thus with a four-pole motor there will be four brush bars, and a six-pole motor will have six brush bars, and so on, each alternate brush bar being connected together with a copper strip. From this it will be seen that there are four paths in parallel for the armature current; therefore, if the armature under full load takes 400 amperes, then there will be 100 amperes in each path. Wave-wound armatures have a two-circuit winding, and the two circuits are in parallel. This winding is the same for all armatures, irrespective of the number of poles in the field magnets, and in the case of the four-pole motor under discussion two or four brush bars may be used. This gives a wave-wound armature a decided advantage over an armature that is lap-wound. As an example, we will suppose that four brush bars are being used and a bar insulator breaks down to earth (this is a frequent occurrence where high voltages are used); it is only necessary to remove the faulty insulator; the motor may then be started, and it will run satisfactorily with the three remaining brush bars. This cannot be done with lap-wound armatures, because if one brush bar is removed, two sections of the armature are cut out, or, at least, two sections are short-circuited by the copper link which connects two of the remaining brushes, with the result that only half of the armature coils are energised, and considerable sparking will take place at the remaining brushes. Again, we will suppose that a break occurs in a coil of a wave-wound armature. This will be apparent by considerable sparking, as the segment of the commutator connected to the faulty coil passes under the brushes. In this case it is only necessary to join the segment of the defective coil to the adjacent segment by soldering or slightly caulking them together on the edge of the commutator. This will not interfere with the brushes as the armature rotates, and the motor will run without sparking. In lap-wound armatures the segments could not be joined together with satisfactory results, because the current would be increased in the short-circuited segments, the armature magnetism would be uneven, and the commutator would commence to be troublesome. From the foregoing it may be said that wave-wound armatures are suitable for high voltages, and lap-wound armatures are more suitable for low voltages.

### ELECTRIC VEHICLES

AT a recent meeting of the Electric Vehicle Committee the final design of a standard sign for charging stations was approved, and a sample of the standard charging plug made by A. Reyrolle & Co. (see *ELECTRICAL ENGINEERING*, Sept. 24th, p. 516) was approved. Some slight alterations were made in the wording of the specification of this plug to make it clear that the handle can be of malleable cast-iron, and to give the option of making the outer shell of galvanised steel or bronze tubing. The Committee had already fixed the standard range of charging voltage as from 85 to 120, and it was decided to make it clear that this voltage is suitable for forty-four lead cells as a maximum. Other matters discussed included alarm signals for electric vehicles, and it was decided to allow the use of electric horns as well as gongs. Mr. P. Still (Engineer and Manager, Chelsea Electric Supply Co.) has been invited to become a member of the Committee.

## HALF-WATT STREET LIGHTING IN MANCHESTER

IT is interesting to note that the Manchester Corporation have erected thirty-eight half-watt lamps in Oxford Street, between All Saints' and Whitworth Street. Both lamps and fittings have been supplied by the General Electric Co. The lamps are fixed opposite each other on the tramway standards, and the distance between them varies from 90 ft. to 100 ft. Current is supplied from bare overhead distributing wires, erected in accordance with the Board of Trade regulations, and with the approval of the Post Office. The lighting gives great satisfaction in Manchester, and it is proposed to extend the system of lighting from All Saints' down Oxford Road and Wilmslow Road to Fallowfield; but the high standard of illumination will not be adhered to throughout the distance. Probably, instead of one lamp being fixed on each tramway standard, as in Oxford Street, the lamps will be "staggered" for the remainder of the route.

## ELECTRIC LIGHT SWITCHING

THE third edition (twenty-fifth thousand) of "Lektrik Lighting Connections," by Mr. W. Perren Maycock, which has just been published, contains descriptions and diagrams of no less than 105 circuits, as compared with sixty-eight of the previous edition. It is surprising to see the large number of types of switches and methods of connecting them for different purposes; but careful classification and indexing and good illustrations prevent the reader from bewilderment. The book, which is of pocket size, is issued by Messrs. A. P. Lundberg & Sons, at the modest price of 6d. (post free, 7d.),\* and every consulting electrical engineer, contractor, foreman, and wireman will find it useful to have a copy. Every conceivable arrangement of switches appears to be dealt with. For those to whom it is difficult even to carry the simple connections of an ordinary two-way switching circuit in their heads, the book will be invaluable; but it should appeal to a wider circle than this. It may not be often, for instance, that one desires to wire a circuit so that all or part of a group of lamps may be switched on or off at any one of three different points; but when such problems as these do arise it is convenient to be able to turn up in a book the exact type of switch required and the wiring diagram, instead of sitting down to the problem and working it out.

In connection with this subject we may refer our readers to an advertisement on p. xi. of this issue, with regard to an electric light switching competition, particulars of which will be published in our next few issues.

\* Copies may be obtained from the Kluwert Publishing Co., Ltd., 203, Temple Chambers, E.C. Enclose seven penny stamps with order.

## ELECTRIC TRACTION NOTES

According to a British Consular report from Osaka, there are now 250 miles of double-track in operation within a radius of fifty miles, and a further eighty miles under construction. The greater part of this district seems to be suffering from the lack of means of communication, and but for stringency in the money market a number of other extensions would have been proceeded with.

With reference to the note on p. 528 of our issue of Oct. 1st, referring to the experiments with the over-running trolley system of trolley 'bus by the Hove Corporation, the Brighton Corporation has notified its disinclination to adopt this method. Unless the under-running trolley is adopted, the Brighton Corporation will ask the Board of Trade to appoint an arbitrator to settle the difference, in order to provide for through running, in accordance with the Act of 1912.

The Government has placed the contract for the construction of the Post Office tube railway with Messrs. John Mowlem & Co., Ltd. The work is to be put in hand immediately, in accordance with the promise given in August by the Postmaster-General, the object being to assist in preventing unemployment at the present time.

Towards the end of last year, the magnetic brake on a London County Council tramcar became inoperative, due to the insulation of a field cable being chafed on a terminal from the blow-out coil at the bottom of the controller. An electrical contact was consequently established, and the effect was to short-circuit the motor armatures, thus preventing current being generated for the magnetic brake. The design of the controller concerned was such that the magnetic

brakes are operative when one motor is cut out. As the result of a communication from the Board of Trade, the Councils of the Municipal Tramways Association and the Tramways and Light Railways Association appointed a Special Committee to report upon the matter. Inquiries and a conference with the makers of various controllers led the Committee to group the faults likely to arise from controllers as follows:—(1) Faults which are liable to occur due to faulty design in the older patterns of controllers; (2) Faults which have occurred in controllers of modern design, owing to the introduction of devices intended as extra precautions; (3) Faults due to lack of attention in the depôts. In the last issue of the *Journal of the Tramways and Light Railways Association* these faults are discussed in some detail. It is regarded as undesirable to introduce additional contacts for special devices, such as run-back preventers, sanding arrangements, &c., and the necessity for proper attention at the depôts is insisted upon.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A description is given in the *Electrical World* of the wireless telegraph station at Sayville, Long Island, which is of special interest as having been constructed to communicate direct with Nauen, and since the cutting of the German Atlantic cables is the only direct link of communication between America and Germany. It appears that a good deal of war news of a kind has been circulated in America purporting to have been received in this way, but there is much scepticism over there as to its genuineness. From the details given it is apparently technically possible for Nauen messages to be picked up by Sayville, and it is possibly more their nature than their origin which has led to their being discredited. The aerial is a twelve-wire umbrella radiating some 400 ft. from a 500-ft. steel tower, and a "counterpoise" or capacity net is provided by an elaborate system of radial wires on 15-ft. poles. The generating plant for sending consists of a 50-kw. motor-generator working in conjunction with a battery; a further motor-generator rated at 60 k.v.a. supplies single-phase current at 600 volts 500 cycles to a 60,000-volt transformer which is connected to a 0.044 mf. condenser of the glass Leyden jar type in five groups. The condensers discharge across a bank of eight quenching gap units with about fifty cooled plate gaps in series, and through the primary of the oscillation transformer. Inductively coupled to this coil is the aerial-to-ground circuit, in which high-frequency current of about 120 amperes is set up. The antenna resistance is given as something under 3 ohms at 3,000 miles wave-length, so that the antenna power is about 35 kw. and the over-all efficiency from the power transformer primary about 75 per cent. to 80 per cent. The transmitting apparatus is controlled by an operator in a distant sound-proof room, while certain adjustments are taken care of by a supervising engineer nearer to the apparatus. Transmission to Nauen has been accomplished experimentally at night, but has not been regularly carried on; but there the writer of the article in question believes that there would be less difficulty in receiving, as Nauen is a larger station and the receiving apparatus is of a character that could pick up messages of a strength and character that would render them difficult of detection by other American stations. This apparatus is said to contain telephone relays of a particularly sensitive pattern.

Marconi's Wireless Telegraph Co. announces the opening of high power stations at San Francisco and Honolulu.

The following answer to an examination question is quoted in the *Post Office Electrical Engineers' Journal*:—"Underground lines are laid in iron pipes, the ends of which are plugged up with solid gutta-percha to prevent the growth of vegetables." Another candidate uses for fault localisation, "the brass ring galvanometer. It is yellow. The galvanometer is connected to a battery and to the cable. The needle will immediately commence to revolve. The greater the number of revolutions the greater the distance of the fault."

The Brazilian Administration stated on the 20th inst. that code and cipher telegrams were not prohibited between Brazil and other American countries.—The Tunis office now only admits private telegrams written in plain English or French, and restrictions regarding telegraphy also now apply to Mossamedes, in the province of Angola.—The land-lines between Puerto Plata and San Domingo are restored, and traffic for Curaçao and Venezuela is transmitted under normal conditions.—The Fao route is down beyond Bassorah.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Oct. 22nd, 1914

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

22,023/13. **Heaters.** C. O. BASTIAN. Methods of mounting heating resistances by winding helically coiled wire on an insulating rod, employing a thread inside the wire helix to hold the convolutions in place while wrapping round the rod, but able to be withdrawn afterwards. One figure.

22,024/14. **Metal Filament Lamps.** C. O. BASTIAN. Methods of mounting helical drawn-wire filaments of incandescent lamps by making use of straight portions of the wire which are left at intervals in preparing the helix. Four figures.

22,348/13. **Accumulator Charging.** H. J. READ and W. J. BRANSOM. A system for interrupting the charging circuit when an accumulator battery is fully charged. An ampere-hour meter acting through an overbalance mechanism and relays trips the circuit breaker when a predetermined reading is attained. Five figures.

22,394/13. **A.C. Hooter.** D. K. MORRIS, MORRIS & LISTER, LTD., and J. L. CATEAUX. A diaphragm hooter in which a small transformer within the apparatus is provided with an auxiliary magnetic circuit which actuates the diaphragm, so that no additional magnet or solenoid is required in the secondary circuit. Four figures.

28,915/13. **Lamp-holders.** A. H. BRACKENSIECK. A water-tight lamp-holder for electric signs, &c., having a cylindrical body with a flange at the front end provided with two recesses to take rubber packing washers to fit either a high-tension or low-tension lamp bulb. Six figures.

8,456/14. **Switch and Fuse.** A. H. SHORT. A D.P. quick break switch with spring fly-off device and fuses carried on the actual switch arms, all arranged in a very compact flat form. Five figures.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Arc Lamps:** RAILING and ANGOLD, 27,582/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.H. Co. (*G.E. Co., U.S.A.*) [Resinous insulating materials] 22,544/13.

**Dynamos, Motors and Transformers:** COATES, MIRREY and A. REYROLLE & Co. [Transformers] 19,919/13; BYFORD and ROBINSON [Control of series motors] 21,623/13.

**Heating and Cooking:** BERRY [Water heating] 22,416/13.

**Storage Batteries:** HANCOCK and DAVID [Battery plates] 19,109/13; NAYLOR [Battery plates] 25,607/13; CLARK & HART ACCUMULATOR Co., LTD. [Cell boxes] 10,107/14.

**Telephony and Telegraphy:** MARCONI'S WIRELESS TELEGRAPH

Co. and VYVYAN [Connection of condensers] 21,672/13; WESTERN ELECTRIC Co., NASH and GRACE [Hand telephones] 22,406/13.

**Traction:** LINDON [Train stops] 23,898/13; BALLINGTON & SHAW [Train stops] 15,632/14.

**Miscellaneous:** JONES [Demagnetising switches for magnetic clutches, &c.] 24,688/13; BLENHEIM [Electric bells] 29,581/13; COOPER [Contact makers] 10,770/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, &c.:** RILEY [Motor control] 17,038/14; SOC. DES ETAB. L. BLERIOT [Driving lighting dynamos] 20,272/14.

**Meters:** LANDIS & GYR, LTD. [Prepayment] 20,458/14.

**Miscellaneous:** HERGENS [Medical apparatus] 20,279/14; BRUCK [Magnetic separators] 20,552/14.

### Amendment Allowed

1,578/14. **Railway Signalling.** L. N. SWAINSON. An amendment has been allowed adding the name of F. A. CORTEZ-LEIGH as one of the inventors. (This specification has not yet been published.)

### Restoration of Lapsed Patent

27,196/03. **C. E. HUNTER. Switches.** An order has been made restoring this patent, which had been allowed to lapse in 1911.

### Expiring and Expired Patents

The following Patents expire during the current week, after a *little* of fourteen years:—

19,451/00. **Condensers.** G. MANSEBRIDGE. Condensers consisting of two strips of paper, each coated on one side with metal wound together in a roll.

19,499/00. **Train Control.** B.T.-H. Co. (*F. E. Case, U.S.A.*). This specification describes a large number of individual features of a complete multiple unit system employing contactors, the control circuits of which are supplied from a secondary battery. There are 34 claims.

19,674/00. **Surface Contact System.** H. H. LAKE (*W. M. Brown, U.S.A.*). This specification describes the studs and other features of the Lorrain surface-contact system of tramway traction.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.H. Co. (*G.E. Co., U.S.A.*) [Current regulation] 14,701/08; H. LEITNER [Distribution system] 15,888/09.

**Incandescent Lamps:** W. HEINRICH [Metal filaments] 16,065/09; POPE'S ELECTRIC LAMP Co. (*Trenzen*) [Metal filament lamps] 16,076/09.

**Miscellaneous:** W. V. JACKSON, F. H. LLOYD, and S. W. SMITH [Electric rolling-mill drive] 15,040/04.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### AUTOMATIC MOTOR CONTROL

WE have recently had the opportunity of inspecting the working of a system of motor control having some interesting features which is being introduced to this country by Mr. H. R. Canfield, and is being demonstrated at the premises of Messrs. Marryat & Place (28 Hatton Garden). The system, which, although new to this country, has been largely adopted in America, has for its principal feature the special form of relay switch shown in section in Fig. 2. The contact plate *G* is supported by a non-magnetic spindle from the main armature cylinder *E*, free to move up and down within the solenoid *I*. The non-magnetic upper spindle passes through a collar, *B*, of magnetic material, and the lower end of the armature or plunger is of reduced section, and passes through the lower magnetic collar *C*. We have thus, between *B* and *E*, the equivalent of an air-gap to the magnetic circuit formed by the core, the outer case, &c., while where the plunger narrows at the lower part we have,

so to speak, an air-gap in parallel with the central magnetic path. The consequence of this construction is that the flux produced by currents from a small value upwards acting through the upper air-gap pull the plunger up or close the switch. As higher and higher currents are applied, however, and the iron is on a higher part of its magnetisation curve, the proportion of flux passing through the air and the iron in the lower gap is altered, and when a certain critical value is reached the pull exerted here counterbalances that which can be exerted at the upper air-gap, and the plunger is prevented from rising. We have thus a relay which is closed instantly by currents below a critical value, while if the current applied is above the critical value, the relay will refuse to close or "lock-out" unless the current is sufficiently reduced, and once closed, however, it will hang on down to almost zero current. The value of the critical current can be adjusted by altering the position of the lower sleeve.

The simplest application of this relay switch is to the automatic cutting in and out of the starting resistances of an

ordinary D.C. motor. In Fig. 1 are shown the connections for a reversing motor with remote control, with the resistance in three sections, each taken care of by a series-wound relay of this kind. When the motor is first switched on, all these

FIG. 1.

FIG. 2.

are open and current is going through the winding of one of them,  $C^1$ , which remains open, as the current is above the critical value; but as the motor gains speed and its back E.M.F. increases, the current reaches the critical value and contact  $S^1$  is closed, cutting out the resistance  $R^1$  and putting the now increased current through the coil  $C^2$  of the next relay. As the motor rises further in speed,  $S^2$  closes in the same way,  $S^1$  remaining closed till, with a further rise in speed of the motor,  $S^3$  closes, cutting all the resistance out

FIG. 3.—REMOTE CONTROL MOTOR PANEL.

and taking current away from  $S^1$  and  $S^2$ , which drop open. A train of these relays can, in exactly similar manner, be employed to limit the current during dynamic braking, and various other features can be added for special purposes. A starter-panel complete with three of these relays and a remote control magnetically-operated main switch is illustrated in Fig. 3, and a large number of patterns with overload attachments, main D.P. switches, and fuses, &c., are standardised, together with a variety of push-button or other control apparatus, reversing and braking controllers, all utilising the system of current-control during acceleration or braking described above.

### A NEW HIGH-TENSION FUSE

A NEW design of high-tension fuse has been introduced by Electric Control, Ltd. (177 Reid Street, Glasgow),

transmission schemes in America. The construction of the fuse will be understood on reference to Fig. 1. The principal feature is the provision of a spring which keeps the actual fuse wire in tension, and on its fusing draws one terminal back, introducing a large gap into the circuit, while at the same time a special fire extinguishing liquid is applied to the arc. The working parts are within a stout glass tube with brass ferrules at the ends. The spring  $A$  is attached to one ferrule, and at the other end to the sliding piston  $B$ , in the interior of which is a funnel-shaped opening for a purpose explained later. The actual fuse wire, which is quite short, is attached between  $B$  and the ferrule at the end of the tube, and is kept in tension by the spring. It also passes through the cork  $C$ . It is obvious, then, that when the fuse blows,  $B$  will be drawn back by the spring, as shown in Fig. 2. The whole tube is filled with a non-inflammable liquid of a dielectric strength of 250,000 volts per in., and the movement of  $B$  through it causes this liquid to be projected against the arc through the funnel-shaped opening mentioned above, and energetically circulated within the tube. Besides its efficiency in extinguishing the arc, the fuse has the great advantage of clear visibility of the fact that it has been in action. Exhaustive oscillograph tests of the breaking capacity of these fuses have been made, and in one case a 1-ampere fuse successfully opened a short-circuit of 1,170 amperes in 0.013 sec. Tests on 110,000-volt circuits with large generator capacity have shown that a very small voltage disturbance is produced. The longest time taken to open the circuit in any of these tests was less than 0.03 sec., which is stated to be at least five times quicker than the fastest working oil-switch, which usually takes four cycles on a 25-cycle circuit. The Company supply special tongs for replacing these fuses, and several descriptions of mountings. 6,600-volt fuses are made, 8 in. in length, from one to 100 amperes, and the complete range goes up to 110,000 volts, at which pressure they are standardised from one to 10 amperes and are 36 in. in length.

**The Electrical Industry and the War.**—We congratulate the Manchester Engineers' Club on having been instrumental in enlisting no less than 1,161 men in different corps. We hear unofficially that the Club's Hon. Secretary, Mr. E. L. Hill, will probably be asked to get another 800 men for the Royal Engineers.

The Hon. Sec. of the Finsbury Technical College Old Students' Association, Mr. F. R. Rouse, 15 Clifton Gardens, Golders Green, London, N.W., seeks the names and as many particulars as possible of all Old Finsbury students who have joined the Forces.

Mechanical and electrical engineers are required for the Cornwall (Fortress) Royal Engineers Electric Light Co. Territorial Force. Full particulars are given in an advertisement.

Particulars of more than 550 students who were in attendance last session and are now serving in his Majesty's Forces are in possession of the Manchester School of Technology. With a view to the completion of a Roll of Honour, including the names of past students engaged upon military service, the Registrar will be glad to receive any information as to such persons.

**Publishers' Announcements.**—Messrs. Constable & Co. have just published "Electric Cooking, Heating and Cleaning," being a manual of electricity in the service of the home, by "Housewife" (Maud Lancaster), edited by E. W. Lancaster. This book goes into the details of domestic service which can so readily and economically be obtained from electricity, is profusely illustrated, and should be in the hands of all electricity consumers, to whom it should be useful in indicating the possibilities of

FIG. 1.—EMPIRE FUSE BEFORE BLOWING.

FIG. 2.—EMPIRE FUSE AFTER BLOWING.

known as the "Empire" S. and C. high-tension fuse, and is already used to a considerable extent on large power

economy and comfort combined with cleanliness, available from the utilisation of electric supply.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**RESISTANCES.**—Leaflets from the Cressall Manufacturing Company, 40 and 41 Staniforth Street, Birmingham, give prices and particulars of woven wire and asbestos resistance netting and resistance "cord" of wire wound on asbestos yarn. These products, which are largely used for heating apparatus as well as rheostats, are made entirely in the company's works at Birmingham.

**ELECTRIC HEATING.**—A neat little booklet from the Edison & Swan United Electric Light Co., Ltd. (123-125 Queen Victoria Street, E.C., and Ponders End, Middlesex), entitled "Ediswan Electric Heaters and Radiators for every Room in your House," illustrates in an attractive way rooms in which full advantage of these has been taken.

**WIRING.**—The principal features and advantages of the Stannos system of wiring with metal-cased conductors are detailed in a handsome new pamphlet from Siemens Brothers and Co., Ltd. (Woolwich), which also gives a good idea of the wide extent to which this method has been adopted by numerous illustrations of buildings wired with Stannos.

**TURBINE GOVERNORS.**—The latest form of the Pitman patent governor for water turbines is the subject of a pamphlet which has been sent us by Percy Pitman (25 Victoria Street, S.W.).

**GLASSWARE.**—A new pamphlet has just been issued by Holophane, Ltd. (12 Carteret Street, Queen Anne's Gate, S.W.), describing special Holophane Glassware for use with Half-watt Lamps, which, owing to the extreme brilliancy of the filament, render it even more important than usual that the light should be properly diffused and directed.

**LUBRICANTS.**—A folder from the Reliance Lubricating Oil Co., which we are glad to note is an entirely British and old-established firm, calls attention to the special points of their lubricating oils, greases, and other products.

**HEATING AND COOKING APPARATUS.**—Price lists from the Dowsing Radiant Heat Co., Ltd., give particulars of a considerable range of electric heating and cooking apparatus, including lamp and "hot bar" radiators, convectors, and radio-connectors in a number of forms, besides complete cooking outfits, ovens, kettles, hot-plates, &c., irons and soldering bits. Some of the designs formerly manufactured by Eastman & Warne, whose business has now been taken over, are included.

**INSULATING MATERIALS.**—A price list of insulating materials for all electrical purposes is to hand from L. Andrew & Co. (2 Whitworth Street West, Deansgate, Manchester).

## FITTINGS FOR HALF-WATT LAMPS

WE illustrate two new patterns of special fittings for half-watt lamps which have just been introduced by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), and added to their already long list of designs. These fittings are adopted for use either indoors or out of doors, and consist of a heavy copper spin-

"ALABAS" FITTINGS FOR HALF-WATT LAMPS.

ning, of pleasing contour, provided with an iron bush suitable for attaching to tube or hook. The lower extremity of the spinning is reinforced and provided with suitable gallery screws to hold either a plain or ribbed Alabas ball, giving excellent diffusion. The lantern is complete with a porcelain holder, and can be easily wired, after the removal of the globe, by detaching the lower portion of the holder. As is very necessary with all half-watt fittings, these "Alabas" lanterns are well ventilated and weather-proof.

## WALL PLUGS AND ADAPTERS

SEVERAL useful combinations of the special earthed wall plugs and sockets lately introduced by A. Reyrolle & Co. (Hebburn-on-Tyne) are described in a new leaflet issued by the firm. Thus in Fig. 1 two complete sockets are shown mounted back to back, forming a suitable coupling socket. Another of the numerous combinations listed is

FIG. 1.

FIG. 2.

shown in Fig. 2, where two plugs and a socket at right angles are combined with a lamp-holder. In cases where more than one flexible is enabled to be taken from one socket by these arrangements, they may be connected either in parallel or in series, as, for example, to enable a dimmer to be inserted into a lighting circuit. The plain plugs and sockets are made up in several forms for horizontal and vertical entry with various styles of brushes and glands, and in a three-pin form with cast-iron case, as well as with two pins and earthing sleeve, as shown in the illustrations.

## SHOP WINDOW LIGHTING

IN view of the reduced lighting of London in connection with the scheme of aerial defence, the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), call attention to the fact that the system of shop window lighting, which they have long recommended, by

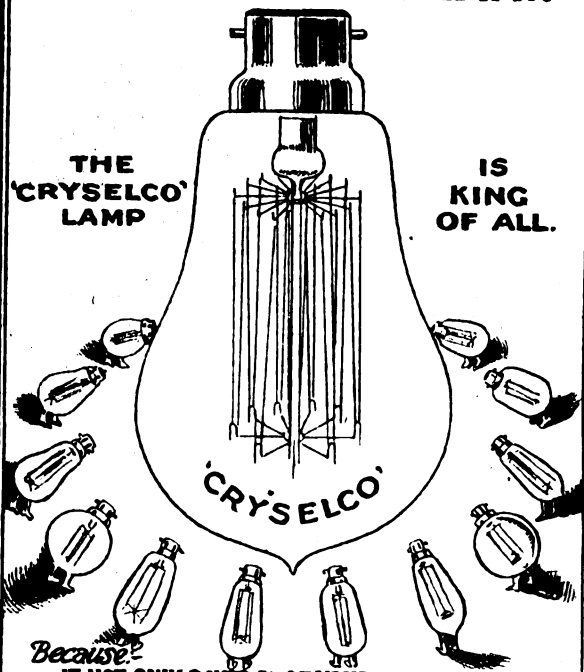

A WELL LIGHTED SHOP WINDOW.

metal-filament lamps in hood-shaped silvered reflectors, enables adequate lighting of the goods in the window to be obtained without infringing the regulations by casting light upon the pavement. The effect of such installation is shown in the illustration.

MORE DURABLE THAN ANY OTHER.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Barrow-in-Furness.**—In order to meet a demand of 5,000,000 units per annum for Messrs. Vickers' shipbuilding yard, extensions estimated to cost £13,000 are to be put in hand.

**Belfast.**—A special meeting of the Corporation is to be held to consider a scheme by the City Electrical Engineer based upon the recent reports of Sir John Snell and Mr. Pratten.

**Bradford.**—A loan of £52,000 is to be taken up for mains, transformers, &c.

**Hastings.**—Mains are to be laid on the Brisco Estate at an estimated cost of £1,185.

**Hawarden.**—Gas engines, generators, switchboard, storage battery, mains, &c. Consulting Engineer, J. W. Speight, Electricity Works, Ormskirk. Nov. 11th.

**Irlam.**—The Council contemplates an electric supply scheme.

**London: Hammersmith.**—High- and low-tension cable. Borough Electrical Engineer. Nov. 4th.

**Melbourne.**—The Melbourne Electric Supply Co. proposes to raise £300,000 additional capital to provide for extensions of plant.

**Oldham.**—Electrification of Wellington Works, Bradburn & Co.

**River Plate.**—The River Plate Electricity Co. proposes to raise £50,000 new capital to provide for extensions of plant.

**Southport.**—A loan of £25,000 is to be applied for. This includes provision for distributors for three years £7,500, and transformers £1,500. In addition, special expenditure upon the Ainsdale district includes high-tension cables and transformers, £900; distributors, £1,950; low-tension transformers, £800; heating and cooking apparatus, £3,000.

#### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barry.**—Labour Exchange. H.M. Office of Works, London.

**Darwen.**—Public baths (£6,550).

**Fleetwood.**—Council school (£12,000).

**Liverpool.**—Smallpox hospital (£90,000).

**Middleton.**—New town hall.

**Preston.**—Smallpox Hospital. Town Clerk.

**Rotherham.**—Technical school (£1,800).

#### Miscellaneous

**Fleetwood.**—North Albert Street and Lord Street are to be lighted by electricity.

**London: H.M. Office of Works.**—Portable electric hand-lamps. Controller of Supplies, 18 Queen Anne's Gate, S.W. Nov. 3rd. (See advertisement on another page.)

**Walsall.**—Twelve months' supply of stores for Tramways Department. General Manager. Nov. 7th.

**West Riding.**—The Yorkshire (West Riding) Electric Tramways Co. requires a twelve months' supply of electrical stores. General Manager. Dec. 4th.

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Cardiff.**—A contract has been placed with Venner Time Switches, Ltd., for forty-nine time switches.

**Eastbourne.**—The tender of Switchgear and Cowans, Ltd., has been accepted for switchgear at £1,026. The following firms also tendered:—Electric Construction Co.; Siemens Bros. & Co.; Spagnoletti, Ltd.; Crompton & Co.; British Westinghouse Co.; General Electric Co.; B.T.H. Co.; Bertram Thomas; Ferguson Pailin; Johnson & Phillips; Cox-Walkers, Ltd.

**Edinburgh.**—The Council has purchased an electric motor-car and lorry for the Electricity Department.

**Newmarket.**—The following tenders have been received for the electric lighting of the workhouse:—Baily, Grundy & Barrett, £361 10s.; C. C. Pudney & Co., £840; Newmarket Electric Light Co., £850.

**Walsall.**—The following tenders have been accepted:—Extra high-tension and low-tension switchgear, Reyrolle & Co.; station transformers, Ferranti, Ltd.

### APPOINTMENTS AND PERSONAL NOTES

Mr. A. P. Trotter's only son, Lieut. Alexander N. Trotter, was killed in action on Oct. 12th.

Acting under a threat that every seat on the Council would be contested next month, the Northampton Corporation has decided to request Mr. J. Gottschalk, the Manager of the tramways, to resign his position. Mr. Gottschalk, although he has been in this country for twenty-six years, was born in Germany, and did not take out naturalisation papers until after the declaration of war, and considerable feeling has been shown in the Council over the matter. The Tramways Committee has already passed a vote of confidence in their Manager, and this was subsequently confirmed at a meeting of the Corporation. Certain people in the town, however, were determined that Mr. Gottschalk should resign, and as a result of their action the Corporation has come to the decision mentioned above, at the same time giving Mr. Gottschalk £300 compensation.

A few first-class telephone mechanics and instrument-makers are required at the Woolwich Dockyard. (See advertisement on another page.)

Three switchboard attendants are required in the Edinburgh Corporation Electricity Department. Applications to City Electrical Engineer, Dewar Place.

A switchboard attendant is required in the Burnley Electricity Department. (See an advertisement on another page.)

## LOCAL NOTES

**Basingstoke: Inauguration of Electric Supply.**—The new electricity works of the Council were formally opened on the 15th inst. The plant consists of two 150-h.p. Diesel engines coupled to two 100-kw. Phoenix dynamos. There is also a 270-cell Hart accumulator, the makers having entered into a maintenance contract at £60 9s. per annum for ten years. The switchboard has been supplied by Cox-Walkers, Ltd. The supply is given on the three-wire system at 460 and 230 volts. Although the undertaking is necessarily on a small scale, the Council has arranged a generous tariff which should do much to encourage consumers to come on to the mains. The lighting flat rate is 5d. per unit, with discount to 4½d. in the case of large supplies; churches, hospitals, hotels, &c., are supplied at 4½d. per unit, outside shop lighting at 3½d., and for power and cooking and heating the charge varies from 2d. to 1½d., according to quantity. Already the L. & S.W. Rly. Co. guarantees to take 50,000 units per annum. The capital expenditure has been £13,600, and much of the work of organising the scheme has been carried out by the Borough Engineer, Mr. F. R. Phipps. The Borough Electrical Engineer, Mr. G. Broadhurst, acted as Clerk of Works during construction, but has now charge of the undertaking.

**Bradford: The 5,000-kw. Bergmann Turbine.**—The report of the Electricity Committee upon the year's working to March 31st refers to the 5,000-kw. turbo-alternator which was ordered in January from the Adnil Electric Co., who are the agents in this country for the Bergmann Electrical Works of Berlin. At the outbreak of war the work had so far proceeded on this set that it was being erected on the test-bed at Messrs. Bergmann's Works. In view, however, of the impossibility of obtaining delivery of this plant, and the urgent necessity of having such a machine in commission at the Valley Road power station at the earliest possible date, the Council in September (ELECTRICAL ENGINEERING, Sept. 3rd, p. 490) placed an order with the British Westinghouse Co. for a 5,000-kw. turbo-generator, which is to be installed on the bed prepared for the Bergmann machine. It is not anticipated, however, that this set will be available for use until early next summer; but as, owing to the war, the load on the works will probably not increase to the extent it otherwise would have done, it is hoped that no difficulty will be experienced in maintaining a satisfactory supply during the winter months with the generating plant already installed, especially if it is found possible to put the new storage battery into commission before the end of the year. The condensing plant and switchgear for the new turbo-alternator have been delivered and almost erected, whilst the battery is now being installed. The foundations are now ready for the induced-draught plant, and the battery, boosters, and work in connection with the battery switchgear and rotary-converter is well in hand by the various makers.

**Electric Cooking and Heating.**—In order to popularise the use of electric cooking apparatus, the Electricity Committee has equipped a complete electrical outfit capable of cooking a meal for 500 persons at the Central Baths in Moseley Street. It is hoped by this means to induce a number of restaurants in the city to follow the lead of London and large provincial cities by adopting electricity for cooking and heating purposes. Incidentally, it may be mentioned that last year, whilst the output and revenue of the electricity undertaking increased considerably, the working expenses per unit sold were the lowest on record, viz., 0.568 per unit, this figure, of course, being exclusive of capital charges.

**Croydon: The London Electric Supply Scheme.**—There are already signs that the local authorities in and around London are not very favourably disposed towards the principle of the L.C.C. new power scheme. Croydon is a case in point, and together with others of the larger municipalities views the scheme as the thin end of a wedge towards complete absorption into the London County area. The present feeling in Croydon seems to be on no account to part with the control of the municipal electricity undertaking.

**The French Red Cross Society.**—A French Committee, which has been formed in the Newcastle district for the assistance of dependants of local residents who have joined the forces of our Allies, has undertaken also to collect funds for the French Red Cross Society, which is in urgent need of financial assistance. Donations may be sent to A. Reyrolle, Esq., Messrs. A. Reyrolle & Co., Ltd., Hebburn-on-Tyne.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £52 10s. to £53. (Last week the same.)

**Heating and Cooking Apparatus.**—The Dowsing Radiant Heat Co., Ltd. (105 Gt. Portland Street, W.), inform us that they have purchased the goodwill, stock, plant, and machinery of Messrs. Eastman & Warne, who have hitherto carried on the manufacture of electric heating apparatus at Acton Vale. The machinery, &c., will be transferred to the Dowsing Works at Acton.

**Limmer Asphalte.**—In order to remove misconceptions that may have arisen, the Limmer Asphalte Paving Co., Ltd. (Caxton House, Westminster, S.W.), point out that the Company is entirely British owned, and has no property in Germany or Austria, that its principal supplies come from mines in France and Sicily and from British Colonies, and that they have never purchased artificial "bitumens" from the Continent. The Directors are all Englishmen, and not a single German or Austrian is in their employ.

**Wm. Sanders & Co.**—We are requested to state that the firm of Wm. Sanders & Co., Ltd., just registered as a new company, is in no way connected with the well-known firm of Wm. Sanders & Co., Switchgear Manufacturers, Falcon Electrical Works, Wednesbury, and 90 Charing Cross Road, W.C.

**S. African Agency.**—An English agent in S. Africa, hitherto representative of prominent German electrical firm, wishes to get into communication with United Kingdom manufacturers of electrical machinery and supplies. Further particulars at 73 Basinghall Street, E.C.

**Callender's Cable and Construction Co.**—The usual interim dividend at the rate of 10 per cent. per annum is to be paid on the ordinary shares for the past half-year.

## NEW COMPANIES

**E. M. EVANS & SON**, 1 Lever Street, Piccadilly, Manchester. Capital £3,000. To take over existing electrical contracting business.

**SIMPLEX SELF-STARTERS.**—Registered by Jordan & Sons, Chancery Lane, W.C. Capital, £10,000. To manufacture electric and other apparatus for starting motor-cars, motor-boats, aeroplanes, &c.

**HIGHFIELD & CO.**—Registered by Jordan & Sons, Chancery Lane, W.C. Capital, £1,500. Manufacturers of electrical appliances, switchboards, &c.

**PHOENIX ELECTRIC HEATING CO.**, 16 and 17 Morwell Street, Tottenham Court Road, W.C. Capital, £3,000.

**A. V. GIFFKINS & CO.**, 68 Victoria Street, London, S.W. Capital, £10,000. Manufacturers of and dealers in all classes of electrical machinery and apparatus.

**DERBY LAMP WORKS**, 9-10, Pancras Lane, E.C. Capital £85,000. To manufacture electric lamps, &c.

**NORTH BRITISH ELECTRIC WELDING CO. (EASTERN)**, 45, Hope Street, Glasgow. Capital, £4,000.

**Arrangements for the Week.**—(To-day) Thursday, Oct. 29th. Institution of Electrical Engineers. Presidential Address by Sir John Snell. 8 p.m. A marble bust of Michael Faraday will be presented to the Institution on behalf of the late Sir W. H. Preece, F.R.S.

Tuesday, Nov. 3rd. Institution of Electrical Engineers. Manchester Section, at Engineers' Club, Albert Square. Chairman's Address by Mr. P. P. Wheelwright. 7.30 p.m.

Wednesday, Nov. 4th. Institution of Electrical Engineers. Yorkshire Section. Chairman's Address by Mr. T. Roles. Smoking Concert to follow, 7.30 p.m.

**Institution of Civil Engineers Awards.**—Among the awards for papers read before the Institution of Civil Engineers last session was a Miller prize for the student's paper by Mr. W. E. Gurry, on "Air Filtration, including Ventilation of Electrical Machinery."

## SUMMARY

SIR JOHN SNELL'S Presidential Address to the Institution of Electrical Engineers last Thursday covered a variety of subjects. He put in a plea for the better remuneration of young engineers and for preference to be given to members of the Institution; he expressed himself in favour of the I.M.E.A. Bill, and viewed the questions of bulk supply and the future charges for electricity from an interesting standpoint (p. 370).

An extremely generous contribution to the war relief funds and their own special relief fund has been made by the Westinghouse employees (p. 572).

THE general question of electric power in collieries was reviewed by Mr. R. Holiday in his presidential address to the Association of Mining Electrical Engineers (p. 572).

A REPORT from New South Wales states that no electrical accidents occurred in 1913 there (p. 572).

THE improvement or power factor on mining electrical installations is discussed in a Paper read recently before the Association of Mining Electrical Engineers (p. 575).

AN improved electrical gas detector is described (p. 576).

THE advantages of electrical winding were mentioned in one of the branch president's addresses of the Association of Mining Electrical Engineers (p. 576).

THE effect of overloads on supply meters is discussed in our Questions and Answers columns (p. 576).

THE L.C.C. is recommended to proceed next Session with a Bill dealing with the supply of electricity to London and the surrounding districts (p. 577).

WE publish a preliminary announcement with regard

to Messrs. A. P. Lundberg & Son's Electric-Light Switching Competition (p. 577).

THE Court of Appeal has decided that the issue of a circular by the Long Eaton Urban District Council limiting their lowest power rates to consumers who took current for all their lighting as well as for power was "undue preference," and in contravention of the Electric Lighting Act of 1882 (p. 578).

WE are able to give the names of the members of the Signal Company of the Royal Naval Division which has been recruited by the Institutions of Electrical, Civil, and Mechanical Engineers (p. 578).

A NUMBER of Englishmen on the staff of the Constantinople Telephone Company are believed to be still in Constantinople (p. 578).

THE subjects of the Patent Specifications published last week include current transformers, connections of condensers for wireless telegraphy, a metal-cased hand combination telephone, a system of water-heating, and construction of battery plates. An application for suspension of certain magnetic clutch patents owned by Germans has been refused. The patent for the Sykes insulated rail joint is expiring (p. 579).

HALF-WATT lamps are now available for motor-car headlights. In our Trade Section we describe recent patterns of electric fires, street lanterns, and dimmer fittings, and give some particulars of the enemy's trade available at the Board of Trade (p. 581).

A 1,500 kw. turbo-alternator is required at Blackpool; a 250 kw. single-phase transformer at Atherton; mains at Finchley; an expenditure of £17,000 is contemplated at Stoke-on-Trent; generating plant is required by the Port Elizabeth (S.A.) Council; and a good market for electrical goods is reported from Russia (p. 581).

THE Belfast Corporation has decided not to erect a new power station at present.—Satisfactory progress is reported at the Chester water-power electricity works.—The Birmingham Electricity Committee is paying £4,500 a year in allowances to workmen on active service (p. 582).

**Arrangements for the Week.**—Tuesday, Nov. 10th. Institution of Railway Signal Engineers, at Institution of Electrical Engineers. Reply by A. H. Rudd to discussion on paper, "American Signal Practice as compared with British Practice." 2.30 p.m.—Institution of Electrical Engineers: Scottish Section, at 207 Bath Street. Address by Chairman, Mr. J. Lowson. 8 p.m. Thursday, Nov. 12th. Institution of Electrical Engineers. "Cables," by C. J. Beaver. 8 p.m.—Greenock Electrical Society, 21 West Stewart Street. "Rotary Converters," by Philip C. Kerr. 7.45 p.m.

**B.T.-H. Recruiting.**—A telegram reading as follows has been received from the Melbourne House of the company: "Congratulations you sending over nine hundred fighters to front. We are proud of them. God speed and victory." Since the notice prompting this telegram the number has increased to considerably over one thousand.

## OPENING MEETING OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE opening meeting of the 1914-15 session of the Institution of Electrical Engineers took place on Thursday, October 29th, there being a good attendance. Mr. W. Duddell, F.R.S., the retiring President, was in the Chair and conducted the formal business before Sir John Snell succeeded him.

It was announced that Col. H. C. Leaf has been appointed a member of the Council in place of the late Mr. A. B. Anderson.

A vote of thanks was accorded to Mr. Evelyn Barnard, a great-nephew of Faraday, for his kindness in presenting to the Institution a framed iron-filings diagram made by Faraday and initialled on the back by him.

The premiums and scholarship cheques were then presented. A list of these was given in *ELECTRICAL ENGINEERING* of May 21st, p. 281.

The next business was the presentation of a bust of Faraday by Mr. Llewellyn Preece on behalf of the late Sir William Preece. In making the presentation, Mr. Preece mentioned the promise by Sir William two and a half years ago, on the occasion of the presentation of the Kelvin bust to the Institution, that he would do his best to present the Institution with a similar bust of Faraday. Unfortunately, Sir William's illness considerably delayed putting the work in hand, but eventually it was placed in the hands of Mr. G. D. MacDougald, the sculptor, who has worked largely under the supervision of Professor Silvanus P. Thompson, to whom, Mr. Llewellyn Preece said, great thanks were due for his advice, which had assisted in producing such a speaking likeness of Faraday.

Mr. Duddell offered the Institution's most sincere thanks for the bust, and referred to the splendid work done by Sir William Preece on behalf of the Institution.

He then vacated the Chair in favour of Sir John Snell, the new President, and, on the motion of Prof. S. P. Thompson, seconded by Dr. Gisbert Kapp, was accorded a hearty vote of thanks for his services as President during the past two years.

### THE PRESIDENTIAL ADDRESS.

Sir John Snell then read his Presidential Address, which touched upon a variety of topics. The following are the main points dealt with by him:—

*The Industrial Committee.*—In connection with the disbandment of this Committee by the Council, after only a short life, Sir John repeated the reason for this already given by the Council. It was, he said, a much more difficult matter to deal with than the critics of the Council's action had appreciated.

Some of the matters referred to this committee, he said, were of a controversial nature, and to give decisions on controversial subjects affecting two sections of the industry which may happen to be opposed in their views must necessarily involve serious and sometimes insuperable difficulties. In his opinion there must be, apart from the Institution, separate bodies to deal with their own immediate and particular interests (for instance, the I.M.E.A., the B.E.A.M.A., the Electrical Contractors' Association, the Tungsten Lamp Association, and the Power Companies' Association), the interests of any two of which might be diametrically opposed in certain cases. On the other hand, the Institution must adopt a sympathetic attitude towards each and all of them, and be ready to help them, or, if asked, to arbitrate between them. He thought that some organisation could be created which would be constantly ready to consider any question that might arise from among the many sectional interests which the Institution incorporates, and suggested the formation of a standing Advisory Committee, composed of the President, three Past Presidents, and three Members of Council. This Committee might be given power to add to its number, choosing from among other members of the Institution. He did not know how this suggestion would commend itself to the Council, and was only expressing his own opinion.

*Organised Lectures.*—It had been suggested that the Institution could do good work by organising lectures in various parts of the country, to educate people in the applications of electric power, lighting, heating, and cooking, but from his past experience this could be more effectively dealt with by the electricity undertakings locally.

*The Textile Committee.*—In 1911 the Council were invited to form a committee to investigate the subject of the electric driving of textile mills, in connection with the Textile Institute. Several meetings were held in Manchester, but they came to nothing, and the Joint Committee was disbanded, because the Textile Institute desired to cover a wider field and to inquire into the relative merits of all available prime-movers whether electrical, steam, gas, or oil. The work of the Joint Committee, however, was not in vain: it awoke the Textile Institute to action in this respect, and in the meantime several mills had changed over to electrical driving and the results of their experience formed a better advertisement than a report from any Joint Committee.

*Model General Conditions.*—Sir John expressed approval of the Institution's new "Model General Conditions for Contracts," expressing the opinion that they establish a very fair relationship between the Purchaser, the Contractor, and the Engineer, and the hope that they will find general acceptance and adoption.

*Remuneration of Young Engineers.*—The Council had been asked at various times to assist in finding positions for their younger brethren and to regularise and improve the status and pay of young engineers, but he did not see that it could very well become either a Trades Union or even a Labour Bureau. He was certain, however, that there are serious causes for complaint from the younger electrical men. He asked fellow-members who are Heads of Departments to give, so far as is reasonable and proper, a preference to applicants who belong to the Institution, and, in fixing salaries, not to think so much of recording a small fraction of a penny less per unit sold on the costs sheets, but to remember first that we were all at one time juniors, that the price of living has gone up and is going up, and that the best can be expected from anybody only if he is adequately paid, and if reasonable opportunities for advancement are held out to him.

*National Service.*—The result of Mr. Duddell's circular sent out at the instance of the specially appointed National Service Committee was that nearly 500 members of all classes offered their services, and a very large majority had volunteered either for service at home or abroad. It was first intended that the Institutions of Electrical, Civil, and Mechanical Engineers should form an "Engineering Institutions" Battalion for service in the field, and that the Institutions should clothe, house, feed, and train the recruits, until the battalion could be handed over to the War Office in a condition of complete readiness. The Institution had been particularly indebted to one of its members, Major-General R. M. Ruck, C.B., R.E., for his invaluable counsel and assistance and for his influence at the War Office. There then came an unexpected proposal that these three Institutions should recruit the Engineer Units for the Royal Naval Division, just then authorised to be formed. The response was so spontaneous that the corps was formed within a few days by men not only of splendid physique, but also of highly skilled intelligence, professional men trained in various branches of engineering, and forming a personnel of the highest value to the Admiralty. All three Institutions owe Mr. W. Duddell, F.R.S., Mr. A. P. Trotter (who was one of the originators of the movement), Mr. Robert Hammond, Colonel D. E. Ruck, R.E., and Mr. Rowell and his staff, who were all indefatigable in their labours as recruiting agents, a great and lasting debt for their untiring energy and enthusiastic assistance in this loyal movement.

It is not the first time, Sir John Snell continued, that the Institution has been instrumental in showing its loyalty to our King and to the Imperial cause. In 1896 the Council appointed a Volunteer Service Committee on which, among others, the late Dr. John Hopkinson, Sir John Snell's old chiefs, General Webber and Colonel Crompton, and Sir Alexander Kennedy, gave their assistance; and in the January of that year Dr. Hopkinson before beginning his Presidential Address announced the suggested establishment of the Corps of Electrical Engineers (R.E.) Volunteers. The Secretary for War appointed a small Departmental Committee to go into the question, and ultimately provision was made in the Army Estimates, and Dr. John Hopkinson was appointed to be the first commanding officer. The first training took place in the autumn of 1897, and during the following year over 100 volunteers were enrolled. At the time of the South African War the Corps volunteered to provide a contingent for active service in South Africa, members of the Institution subscribed to provide a fund for the purchase of field plant, and in 1900 the fully equipped contingent embarked at Southampton for South Africa. No less than 330 out of a total strength of 500 served their country in this campaign. The Electrical Engineers (Territorial) R.E. battalion is in the King's service to-day, and the members of it are on duty under the command of Lieut.-Colonel Le Rossignol, R.E., at several of the important defence works. Only the other day one of the officers of the Corps wrote to ask Sir John if the Institution's influence could be exerted to enable some of them to go to the front—over 70 per cent. of the officers and men having volunteered for active service. Many members are also serving in the Signalling Corps of the London Army Troops under Colonel E. H. Leaf, R.E., men able to utilise their skilled experience in telegraphic and wireless services.

*Legislation.*—No case has, of course, yet arisen from which an indication can be gleaned of what will be the interpretation of the terms of purchase under the Electric Lighting Act of 1888. Under tramways purchase procedure the value to the seller is taken based on the cost of replacing the plant and mains, &c., as they are at the time of purchase, but reduced by an amount for depreciation, having regard to the then ages and the estimated useful lives of the component parts. The Electric Lighting Act terms are, however, enlarged as compared with the tramway terms, in that allowance has to be made for the undertaking's being in a condition ready to supply, and an allowance for severance has to be made if the municipal and electrical areas are not the same. Thus some difficulties will no doubt arise when the purchase of the earlier undertakings falls in in 1924, and there will be plenty of work then for the Bar, and also for a few members of the Institution.

Except in the further facility needed to allow undertakers to establish showrooms and to let fittings on hire, with due regard to the interests of electrical contractors, Sir John does not see that much improvement can be suggested on the present

laws affecting the supply of electricity. He feels, however, that the suggested Advisory Committee might review the present legislative position, compare it with the legislation affecting water and gas undertakings, to see whether there are any further facilities or improvements which could be enacted, such as the "protection of property" clause, for example, and facilities for wayleaves where consent is unreasonably withheld.

Sir John expressed his regret that the electrical profession has not some members in Parliament to represent it, and suggested that a few should volunteer and offer themselves at future elections.

Referring to the I.M.E.A. Bill, the President said that, as now drafted, it had received the support of the Manufacturers' Association, but he understood that the Contractors' Association does not approve of it. Speaking from an entirely detached and independent position, he could not but feel that non-agreement is regrettable and contrary not only to the public interests, but to the interests of the contractors themselves. Contractors would not be competed with by the supply authority in any wiring contracts, and although there would be competition in "providing, selling, letting on hire, fixing, repairing and maintenance of fittings, apparatus, and appliances for lighting, heating, and motive power," there were proper safeguards to prevent the public authority from undercutting contractors. He supposed that supply authorities did not want to make profits out of the sales of apparatus so much as to increase the output and revenue from energy sold; and surely a reasonable compromise could be arrived at which would be mutually advantageous. Increase of business should be the first direct result of the passing of a Bill of this nature, and therefore more wiring contracts. The addition of such a measure to the existing Electric Lighting Acts would appear to be of immense value to all interests, and a way should be found to pass it in a form which would bring the greatest benefits to contractors as well as to the supply authorities.

**Bulk Supply.**—Both points of view were considered in the Address. In some cases where there are existing small power stations, some of them unfavourably situated for cheap generating costs, it would probably pay to extend one of the better placed stations only and to supply the others therefrom, rather than to extend each local station from time to time. A case in point was mentioned, in which there are five separate electric power stations within a radius of six miles, four of which are not favourably situated, either for coal supply or for water, while the fifth and largest place has a waterside station. In this case concentration at the larger station would far outweigh the extra costs of transmission cables and transformer plant and the losses in transformation. On the other hand, once a small station is built and the expenditure has been incurred, the extra operating cost of an addition to the local power station is often cheaper than any commercially feasible bulk supply. He had had to inquire minutely into many such cases, and in most of them the decision had been to extend the local plant. A case arose a short time since where a comparatively small station—less than 2,000 kw.—required supplementing. The annual load factor, based on 30 minutes' sustained load, was 36 per cent. A neighbouring very large undertaking offered a bulk supply at very low terms—far lower than any terms yet mentioned in the various London power schemes. Yet it was impossible to demonstrate that it would pay to purchase all the energy locally required from the bulk supplier, because of the dominating effect of the capital outlay and the standing charges on the existing local plant. Finally, the best terms were made for both parties by the local station undertaking to run its plant for one shift during only four months of the year, thus entirely taking the local load off the winter demand of the bulk station—that is to say, a co-operative system such as was proposed in the original London County Council schemes seven years ago. Sir John Snell finally expressed the opinion that no economy can be shown in the generality of cases where there are modern and properly managed undertakings whose capital expenditure on buildings and plant is not yet redeemed or written off, unless energy can be supplied by a bulk authority at rates not exceeding £2 10s. per kw. of maximum demand and 0.25d. per unit delivered for untransformed high-tension energy. He recommended, however, that in the case of a new local area it would be well to obtain terms from a bulk-supply authority before deciding to build a local power station; or, better still, in many cases for the local authority to find the capital to build its local sub-stations and to lay its distributing network at probably cheap rates of interest, but to arrange for the administrative work and upkeep of the local system to be undertaken, under proper supervision, by the bulk authority. He suggested that a complete survey should be made by the Local Government Board of the present position of all the electrical authorities, so that in those cases where amalgamation or purchase of energy from an outside source ought to be adopted the Board would decline to sanction any loans for local plant extensions.

**Domestic Supply.**—Sir John expressed the definite view that the cost of two independent systems of wiring in one residence is a brake upon progress. After mentioning that electric lighting was now "almost unnecessarily cheap," he exhibited Fig. 1 (from an actual case) to show the very great diversity indeed

between the lighting and cooking loads. It shows that while the lighting and power connections are steadily rising, the heating and cooking connections are increasing at a greatly accelerated rate; but the maximum load on the power station is rising proportionately to the lighting and power only, and is practically unaffected by either the heating or cooking additions. Analyses of daily load curves showed that the daily load factor in the summer had increased from 26 per cent. to 37 per cent. for comparable days in three successive years, and in the winter from 38 per cent. to 42 per cent. The effect on the daily load factor was therefore more marked in the summer, and the result was to level up the daily load factor throughout the year. Confirmatory results had been obtained in other districts. It was

FIG. 1.

safe to say that a great increase in the output for the purposes of domestic supply must be provided for. In some cases he found that the ratio of other domestic units to the lighting units is as high as 10 to 1. An average of all the private residences in one provincial town gave a ratio of 3.5 to 1; shops, however, only gave a ratio of 1.2 to 1, while offices gave the highest ratio, viz., nearly 5 to 1. He thought it quite probable that in the near future existing consumers who now take energy only for lighting or heating to a very limited degree would be purchasing from 4 to 5 times the number of units metered at present. The increased load factor and larger output will react on and reduce the costs of production, and increased output of utensils and apparatus will reduce their cost. Initial outlay is usually the greatest deterrent to the adoption of an electrical supply, and, why, he asked, should a consumer have to pay for two separate and complete wiring systems in his house? The single wiring would mean an adjustment of the rates to suit the circumstances, and he looked forward to a general rate of 1d. per unit for domestic supply, although the time was not quite ripe yet. For the present, most undertakings must have recourse to either a fixed charge per kilowatt (or fraction of a kilowatt) connected, plus a minimum charge per unit metered, or where assessments permit, a fixed charge based on the rateable value, plus the running charge per unit metered.

**Future Charges to Consumers.**—"We have heard of prices such as a farthing per unit, and even one-eighth of a penny. To my mind it is unwise to speak loosely of sensational figures like these unless there is substantial evidence to support them." With his introduction, Sir John proceeded to estimate roughly the limits to which charges might be expected to be reduced under existing conditions. The average cost to the consumer in this country, he said, is now 1.56d. per unit, and in London it is 2.15d. Making a short digression, he first referred to the tendency on the part of the larger cities such as Manchester, Glasgow, and Birmingham, to sell in bulk to their neighbouring and surrounding towns and districts, and the better disposition on the part of such smaller districts to take the supply from their larger neighbours. Fear that the electrical supply is the "thin edge of the wedge" of complete municipal absorption by the larger city represented one of the principal obstacles, in addition to the one already pointed out. It had proved to be very hard work to build up the power companies, and very few could be said as yet to be in a really sound financial position, although they had done valiant work. The principal towns already had their own power stations, and desired to have electrical undertakings under municipal control, and the difficulties of obtaining wayleaves for transmission lines, the capital cost of transmission, together with the cost of money itself, had all been, and still were, obstacles to the development of such large areas of operation. Some of these difficulties, he said, are yielding. Many local authorities are now more disposed to consider the alternative of bulk supply. The cost of transmission by cables at high pressure is very much less than it was a few years ago. The Board of Trade helps, so far as legislation now permits, in the development of overhead lines. There were many factors to be considered, and undertakings above a certain size

and output were bound to continue independently. Faraday had once remarked that we must be "not too hasty to generalise, and above all things willing at every step to cross-examine our opinions." This was wise counsel, and, after due self cross-examination, Sir John said that he still holds the opinion that in this country the local undertakings in the majority of cases will not be merged in larger and widely distributed systems.

Returning to the question of minimum cost of supply, he took an ideal case of generation on a large scale from power stations dependent on fuel, and transmission to various parts of an extended province, partly by overhead lines at 30,000 volts, and partly by high-tension cables. He assumed further that the output embraced a supply to railways and other traction systems, wide classes of industries, and also that the domestic supply reached the extended application which he had suggested. The resultant average annual load factor at the power stations might then possibly reach 50 per cent.

The detailed cost of such a power station per kilowatt could be taken typically as follows: Land, &c., £0.25; buildings, &c., £2.00; boiler plant, £3.25; generating plant, switchgear, &c., £2.65; total, £8.15.

Including the generating costs and interest at 5 per cent. and depreciation of these capital charges, the total cost per unit sold would work out as follows: Equivalent generating costs, 0.247d.; distribution, 0.054d.; rents, rates, and taxes, 0.050d.; management expenses, 0.022d.; capital charges on sub-stations and mains at £25 per kw. at 11 per cent., 0.167d.; total cost per unit sold, 0.54d.

The proper charges to consumers (allowing for a reasonable diversity factor) are then estimated to be:—Lighting (12½ to 15 per cent. load factor), 1.2d.; heating and cooking (40 to 45 per cent. load factor), 0.447d.; and public lighting, and also power, according to load factor as in the curve below (Fig. 2). For special "non-peak" loads a charge down to 0.15d., according to circumstances, is proposed.

Now, Sir John points out that even if the cost of coal could

FIG. 2.

be eliminated—such as the sale of by-products, which would balance the coal cost, the average cost of 0.54d. would only be reduced to 0.40d., and the average charges to lighting consumers would still have to be 1½d., while industrial consumers with ordinary load factors would have to pay prices ranging from 0.66d. to ½d. if the costs were properly apportioned. Or, again, if the capital cost of the complete undertaking were reduced to half of that taken as a basis in the above figures, which would mean only £4 per kilowatt installed for the power house, and £12.5 per kilowatt installed for the sub-stations and mains (figures one may safely say cannot in any reasonable probability be ever reached), still the average cost of a 50 per cent. load factor would be 0.42d., and the lowest permissible charge to a lighting consumer would be 1½d., and to an ordinary industrial consumer from ¾d. to ½d.

This section of the Address concluded with a plea to engineers to assist in preventing wastage of our great national asset, coal. The greatest losses occur in the steam-raising plant, of course, and in the heat rejected to condensers. Station engineers, he said, would do well to keep a regular log of the analysed losses and go further than merely checking the thermal values of coal purchased and the weight of coal per unit generated. He thinks that it would pay in all but the smallest stations to have an assistant whose duties would wholly consist in noting the thermal values from the coal consumed right down to the remaining value per unit delivered to feeders, so as to improve the results and to minimise waste.

**Capital Investment in Electrical Works.**—As an indication of the development of electrical undertakings and companies in the British Empire, the following figures show a remarkable amount of capital invested:—310 manufacturing companies, £46,703,047; 173 miscellaneous companies, £8,756,417; telegraphs and telephones, £37,249,088; 269 electrical supply companies, £58,364,885; 262 municipalities, £49,656,951; 104 tramway undertakings, £56,012,466; total, £256,742,854. This huge total does not even then include Government telegraphs and telephones, power companies, or the capital invested by railway companies in electrification, which would greatly increase this total. When one considers that in a period of thirty years over 250 million sterling has been invested in electrical undertakings of various kinds, none can deny that electricity has become indispensable to the service of mankind.

**Trend of Improvements.**—We are, said Sir John, gradually arriving at definite and accepted methods: Three-phase generation, turbo-alternators of the highest adaptable speed coupled to machines with one bar per slot and having the lowest consequential terminal pressure, stepping up through static transformers, higher feeder pressures, and distribution by the three-phase four-wire system.

In the manufacturing section steady progress towards standardisation is being made. If plant of whatever kind can be turned out in quantities, the articles are cheaper. Whether it be units of energy or motors, the curve of cost per unit or per motor will be hyperbolic. There are fixed charges and running charges in both, and the greater the quantity, the smaller the cost of each. Some Continental competitors, by absorbing the fixed charges at home, have delivered machines and materials here at prices which have been based on the "running costs" only. In so doing, however, they have improved their own factory load factor and increased their prosperity. Our manufacturers have an opportunity now. Sir John deplored the waste which takes place in most cities through the constant taking up and relaying of pavements by the gas, water, telephone, and electrical authorities, and advises some co-ordination. In the design of extensions of the distributing systems themselves he maintained that unnecessary copper and lead are often laid down in a hurry, when a skilled consideration of plans prepared well in advance would generally result in economies, while affording at the same time a better pressure distribution and greater facilities for sectionalising the system in emergencies.

A vote of thanks to Sir John Snell for his interesting address was proposed by Mr. W. M. Mordey, seconded by Mr. C. H. Wordingham, and carried by acclamation.

## THE BRITISH WESTINGHOUSE COMPANY AND THE WAR

AT the outbreak of the war the British Westinghouse Co. found it necessary to put the workmen on reduced time, and also to reduce the salaries of the staff to two-thirds. Business rapidly improved, however, and full time was reverted to, and not only were the salaries of the staff made up to normal again, but, as the staff had been working full time in spite of reduced salaries, the previous reductions were returned to them as back salary. A large proportion of this was allotted by the members of the staff to the Prince of Wales's and other relief funds. A total of £1,170 was distributed.

Shortly afterwards it was decided to start a fund to which all employees of the Company could contribute by the week or month, by authorising the Company to make deductions from their salaries and wages, to form a stand-by fund primarily to be paid to Westinghouse employees, and that, if necessary, it should be used to augment the grants already paid by the Company to dependents on Westinghouse employees, out of the £100 per week set aside by the Company for the purpose. Up to Oct. 21st the sums so deducted from salaries and wages amounted to £974.

No less than 950 men have left the British Westinghouse Co. up to date to join either the Army or Navy.

**Electric Cooking on Submarines.**—It is not generally known that one of the most successful applications of electric cooking is on submarines. On all, or at any rate a great number of British submarines, the cooking is done by electricity with current supplied by the battery which furnishes the power to drive the vessels when submerged. We understand that various makes of cookers are employed.

**The War and the Professional Classes.**—A number of influential men and women have formed an association known as the Professional Classes War Relief Council, presided over by Major Leonard Darwin. The very excellent object of this Council is to form and administer a fund to assist those of the professional classes not coming within the range of the other relief schemes who may be in straitened circumstances owing to the war. Donations may be sent to the Treasurer, Professional Classes War Relief Council, 13 and 14 Princes Gate, S.W.

**Electrical Tar Separation from Gas.**—It has sometimes caused amusement that electric power should be employed in the gas industry, and it is interesting to note another application of electricity in gas purification described in our contemporary, the *Gas World*. This is the application of a high-tension discharge at 40 to 80,000 volts to produce a highly ionised field through which the gas is passed. This causes an agglomeration of tar spray or mist into large drops which are easily separated. The step-up transformer is contained within the ioniser so that there are no exposed high-tension leads. The apparatus is in use with success for detarring gas at a coke-oven plant at Detroit, and has also been used for cleaning producer gas at the Ford Motor Co.'s works, Detroit.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

### ELECTRIC POWER IN COLLIERIES

AT the annual meeting of the Association of Mining Electrical Engineers last month, Mr. R. Holiday (General Manager, Ackton Hall Colliery), the new President, gave his Address, entitled, "The Economic Justification for the Use of Electrical Power in Collieries." As the value of electric power began to be realised for colliery purposes, many generating plants driven by high- and low-speed engines were put down; but it was the introduction of the low-pressure and mixed-pressure steam turbine that gave the use of electric power in collieries the necessary incentive to ensure its almost universal adoption. There were to-day numerous cases where the power obtained from the energy remaining in the steam which was exhausted from the non-condensing winding engines was sufficient not only to provide for all auxiliary requirements of individual collieries, but to provide a surplus from a group of pits to drive another pit wholly by electric power, including the winding engines. The same applied to some extent to the gas engine using waste gases from by-product coke-oven plants. During the initial fight against electric power as a new thing the principal point urged against its use was its unreliability. To-day the reliability of electrical plant was scarcely even questioned, although there was still diversity of opinion as to its safety. It lay very largely with members of their Association not only to prove that it was safe, but to make it so. Many accidents attributed to the use of electricity were due rather to the use of defective or unsuitable apparatus. So far as the surface was concerned, there was no question as to the safety of electrical apparatus; the principal risk lay underground, but if full advantage was taken of modern methods this risk could be greatly minimised, if not wholly obviated. In many mines there were places where, due to the continuous presence of gas, electrical apparatus ought not to be installed, and there were other places where, though normally gas was not present, at any time gas might be found. It was for the colliery managers and their advisers to put into such places electrical apparatus which was not only safe in normal circumstances, but also under these abnormal conditions.

Turning to the question of economy, he said that increasing attention was being paid to savings in the cost of fuel used for power purposes which could be effected by the use of by-products. When low-pressure steam turbines were driven from the exhaust steam of winding engines, the saving in steam consumption due to condensing alone could be taken as 25 per cent., and by utilising the steam for power generation 45 per cent., or more than sufficient to pay for the extra capital involved in the turbines. There were also enormous gains in the power transmission efficiency as compared with steam pipes, and both capital cost and maintenance expenses for electrical plant were lower than for an equivalent steam system, and on the score of efficiency alone the use of the electric motor was justified. In an existing plant, a reduction in the boilers of 40 per cent. might be made by the utilisation of the exhaust steam, or a saving in annual expenses sufficient not only to provide interest and depreciation on the plant scrapped, but to provide interest and depreciation on the electrical plant, and leave a profit as well.

### ELECTRICITY IN MINES IN NEW SOUTH WALES

THE annual report of the Department of Mines of New South Wales for 1918 contains various references to electrical mining work. The Electrical Inspector, Mr. H. G. Carter, reports that during the year no electrical accidents of any kind have been reported. "The use of electricity," he continues, "in and about the mines has greatly increased, and its usefulness as a means of obtaining motor power is being more appreciated. This increase has chiefly taken the form of sub-haulage gears, pumps, and coal-cutting machinery. A large central power station has been erected at Richmond Main Colliery, part of the plant being now in operation for driving the main ventilating fan, air-compressors, and haulages at Pelaw Main and the main winding engine at Richmond Main. Other large power stations are being built at Stanford

Merthyr and North Bulli Collieries, high-tension three-phase transmission being used in both cases to supply underground sub-stations. The advantages of using high-tension three-phase current is becoming generally recognised, and quite a number of mines, which previously employed low-tension current, have changed to this system. It is very satisfactory to note that the general condition of the electrical equipments throughout the mines is good. The colliery managers have shown themselves willing to keep their installations in strict conformity with the electrical special rules, and the mine electricians are also becoming more experienced."

A very thorough system of inspection seems to be in force, and all mines employing electrically-driven coal-cutters have to be inspected quarterly. During the year, 10 candidates out of 15 passed the examination for the certificate of competency as mine electricians, bringing the total number on the register up to 81. In the examinations for electric motor drivers, 78 candidates passed out of 106. The extent to which electricity is employed in New South Wales coal mines may be gathered from the following figures, which are computed from a table given in the report:—Out of a total of forty-eight collieries all except three are electrically equipped. Their generating plant aggregates about 8,780 kw., the individual plants ranging up to 890 kw. and being mostly under 500 kw. Alternating current exclusively is employed at only two mines, both A.C. and D.C. at twelve, and D.C. only at the remainder. One hundred and fifty-four electric coal-cutters are in use, and 59 haulages, 100 pumps, and 35 fans are electrically driven. Eighty-five motors are also used for other purposes. There is a considerable amount of electric lighting, both underground and on the surface. Electric signalling is used at forty-five mines, and telephones at the same number. Electric safety lamps have not yet come into use, but several companies have already ordered considerable numbers, and the inspectors are favouring their employment.

Electrical methods for the reduction of metals are used by the Electrolytic Refining and Melting Co. of Australia, Ltd., at their works at Port Rembla, and during the year £552,884 of gold, £45,788 of silver, and £944,160 of copper. The amount of copper is stated to be less than that for the previous year, on account of foreign competition.

**Electric Steel for the Allies.**—*The Iron and Coal Trades Review* reports that the Cie. des Forges et Aciéries Électriques, at Ugine, is working its large electric furnace plant day and night for the production of special steels for the French army and navy. The latest addition to the equipment is a Girod furnace capable of melting up to 25 tons of cold charges of scrap iron and steel. The plant has been remodelled and now contains two Girod electric furnaces of 2½ tons capacity each, two Girod furnaces of 10 to 12 tons capacity each, and one furnace with a capacity up to 25 tons of cold charge. A separate plant in the same town produces ferro-alloys by means of the electric furnace.

**Armoured Cables in Haulage Roads.**—At Hamilton recently, the Shotts Iron Company and some of its officials were prosecuted for failing to have certain cables along a haulage road protected by a metallic covering. It appeared that the cables were originally put in before the date when the new Regulations came into force in another part of the mine, being thus exempt from the regulation, but had lately been moved to the haulage road. The question was whether, owing to this removal, they were to be classed as new work, and not still entitled to exemption. The Sheriff held that this was so, and inflicted a nominal fine of £1 on the company, dismissing the charges against the officials.

**West of Scotland Branch of the Association of Mining Electrical Engineers.**—The opening meeting of the session was held on Oct. 19th at Glasgow, when Mr. A. B. Muirhead, branch president, gave his inaugural address, dealing with the maintenance of electrical plant in mines and the great improvement there had been from an engineering point of view in mining plant. Prizes were given to Mr. J. R. C. Kidler and J. A. Kerr for papers read by them last session.

**The Association of Mining Electrical Engineers.**—At a joint meeting of the Scottish branches of the Association of Mining Electrical Engineers and the National Association of Colliery Managers, Mr. Bowman (Uddingston) will read a paper on "Electricity at the Coal Face."

## POWER FACTOR AND ITS IMPROVEMENT

A T a recent branch meeting of the Association of Mining Electrical Engineers, a Paper on the above subject by Mr. L. G. F. Routledge, of the Notts and Derby Branch, has been read and discussed. The Author said the matter was of growing importance with the increase of three-phase working in mines, and explained how the power-factor of the system was made worse by the employment of arc lamps and small lighting transformers, power transformers when lightly loaded, and induction motors. The effects of low power-factor were: Limitation of plant capacity and high capital costs; excessive losses and low efficiency of generators; consequent decreased efficiency of prime movers; excessive line, transformer, and distribution losses; consequent abnormal temperature rise everywhere; excessive voltage drop; bad regulation of generator and transformer voltage; possible continuous overloading of exciters; abnormal conditions in the operation of switchgear; errors in instruments, more especially energy meters. To meet these it was sometimes necessary to increase the k.v.a. capacity of the generators and transformers, and of the transmission and distribution systems. A possible way of reducing power-factor that might be applicable in certain circumstances was the series system of the British Electric Transformer Co. (see ELECTRICAL ENGINEERING, Vol. III., p. 197, Feb. 6th, 1908), in which a small transformer automatically replaces the full-sized one at times of light load. The use of synchronous and rotary-converters was also discussed as a remedy for low power-factor; the former could be adopted whenever a D.C. supply could be used for auxiliary purposes, and among mining purposes, where synchronous motors could be employed, were on endless rope continuously-running haulages, and pumps in the intake. Mr. Burnand had proposed a transformer device with small motor consisting of a transformer with tapplings arranged to supply different voltages to the motor, according to the load. This depends for its success on the fact that an efficient transformer had a smaller loss than the reduction effected in the motor losses.

The Miles-Walker phase advancer (ELECTRICAL ENGINEERING, Vol. IX., p. 31, Jan. 16th, 1913), the Brown-Boveri phase advancer, and the Kapp vibrator (ELECTRICAL ENGINEERING, Vol. IX., p. 239, May 1st, 1913), were also described in the Paper, and several colliery installations where the first two were at work were mentioned. It was also pointed out that an improvement in power-factor could be obtained if three-phase commutator motors were substituted for induction motors. The last method to be dealt with was the use of static condensers either of the Moscicki or Helsby types. An 864 m.f. condenser has been put in at Eastwood Colliery for this purpose. The author considered it likely that in the future, as experience proves the reliability of this apparatus, the advantages of relative cheapness and small attendance required will lead to the increased adoption of the condenser. He mentioned that at the present time the British Insulated & Helsby Cables, Ltd., were experimenting with a much improved pattern of condenser with a new dielectric. It seemed, however, that the largest improvements of power-factor from a commercial point of view were to be obtained, where motors above 130 or 140 h.p. were in operation, by connecting phase advancers or vibrators to the rotor circuits. If all the motors in use were smaller than this size, the static condenser seemed to hold the field entirely, owing to the way it might be sub-divided, and units of quite small capacity attached to different parts of the circuit.

**Electric Miners' Lamps.**—At a meeting recently of the Midland Institute of Mining, Civil and Mechanical Engineers, at Leeds. Mr. E. A. Hailwood, in a Paper on Electric Miners' Lamps, compared with oil lamps, gave results of experiments, showing that it was quite possible to produce ignition of gas by breaking the lamp bulb when alight, thus demonstrating the necessity for adequate mechanical protection and enclosure of the lamp bulb. He also referred to the advantage of the flame lamp in being its own gas indicator, and complained that in many electric lamps the actual candle power was considerably below that specified. As Mr. Hailwood's remarks formed to a considerable extent a defence of the oil lamp against the electric lamp, the matter was taken up strongly in a letter from Mr. S. A. Rybert in the *Colliery Guardian*, who points out that the danger from damaged flame lamps is much greater than from damaged electric lamps, many of which automatically cut the current off from the lamp on breakage of the outer glass. The light, he says, from electric lamps, even if it sometimes falls from the specified value, is still considerably greater than that of oil lamps.

## AN ELECTRICAL GAS DETECTOR

**A**N improved form of electrical gas detector for mines, which is the result of considerable experimenting with older types, was described by Mr. G. J. Ralph in a Paper recently read before the North of England Institute of Mining and Mechanical Engineers. The instrument depends on the comparison of the resistances of a sensitive catalytic wire exposed to the atmosphere and a similar sealed-up wire. The absorption of combustible gas by the catalytic wire raises its temperature, and a corresponding increase of resistance is produced, which, by proper calibration, can be made a measure of the proportion of inflammable gas present. The two wires are contained in the arms of a Wheatstone bridge, and a slide wire in dial form enables a direct reading to be made after setting a pointer to produce no deflection on a zero galvanometer which forms part of the apparatus. Current is supplied either from a separate 4-volt battery or from the battery of a miners' lamp with special plug connections. The instrument, with its galvanometer, resistances, pointer and dial, &c., is strongly and compactly made, and is of smaller size than the ordinary electric miners' lamp.

## ELECTRICAL WORKING OF COLLIERIES

**I**N the course of his Presidential Address to the North Staffordshire Institute of Mining and Mechanical Engineers at Stoke, on Oct. 26th, Mr. J. Gregory, referring to the growth of electrical working in mines, said that only a few years ago an engineer who suggested the employment of electric motors in place of steam winding engines would have been scoffed at, and yet to-day, in spite of an enormous increase of depth and load, there were few instances where, in laying out a new colliery, a considerable advantage could not be obtained by their use. The length of time occupied in a single wind was so short that the utmost attention had to be devoted to the periods of acceleration and deceleration, and it was here that the electric motor scored. A great advantage lay in the even turning moment of the motor, which, especially in the case of deep shafts, contributed to the steadiness of the winding rope. Many collieries now took the whole of their power from large power supply companies, and in some cases an advantageous arrangement had been entered into whereby current could either be taken from or delivered to the company, according to the state of the load. It was particularly in the case of new collieries that electrification showed its advantages. Where steam winding was employed, exhaust and mixed pressure turbines enabled a serious wastage of power to be checked. As regards electric power for purposes other than winding, motors aggregating 16,000 h.p. were in use in the North Staffordshire Collieries alone. The advantage of centralised power supply was further emphasised in seconding the vote of thanks by Mr. Hassam, who regretted that there was no large power supply system to draw upon in their district. He mentioned a case of a colliery which would probably have adopted electrical working throughout if such a supply had been available, but where the directors did not consider that a separate generating plant would pay.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

### QUESTION No. 1,415.

The querist is interested in the running of rotary converters, and would like to hear of the experiences of station engineers with regard to the behaviour of the A.C. brushes and slip rings.

In the last year or two the tendency has been to use brushes of a metal-carbon mixture in preference to the copper-leaf brushes invariably fitted to the earlier machines. Some of these earlier machines, if not most, ran for many years before renewal of the slip-rings became advisable, but the writer has known of several machines, using composite brushes, where the wear has become a serious matter. It would be interesting to hear the opinions of engineers with both types.

The trouble, if it is general, may not be due to the material of the brushes, as excessive current density may count for a great deal, but there may be something in it, as the writer believes that there are one or two corporations who insist on having copper-leaf brushes. A. G. T. C.

(Answers must be received not later than first post Thursday, Nov. 12th.)

### ANSWERS TO No. 1,412.

A consumer, without notifying the supply authority, increases his load so that for one or two hours every day the load exceeds by 50 per cent. the rating of his meter. What will be the effect of such a procedure on the chief patterns of meter on the market, and what indication will the supply authority have that this has been done? It is of course assumed that the main fuses have not blown.

The first award (10s.) is given to "OHM" for the following reply:—

It is not stated in the question whether the supply is alternating or direct current, but in either case a well-designed meter which is calibrated to read correctly at full normal load will register less than it should do on a 50 per cent. overload to the extent of from  $1\frac{1}{2}$  per cent. to 3 per cent. In certain cases the error may even be greater than 3 per cent., but as a general rule the meter will *always run slow on the overload*, and if the particular meter in question be one of repute, the error will lie between the limits given above. No permanent injury to the working parts, or effect on the accuracy, will result from the overload, which is only maintained for a comparatively short period; and after the normal load is again restored there will be nothing whatever to indicate to the supply authority that the consumer has been surreptitiously overloading his meter, other than, of course, the abnormal registration of the meter dial. The only possible way, therefore, of detecting the overload is for the supply authority to connect in series with the meter a maximum demand indicator which will give a permanent record of the maximum load reached during any given period. In connection with this matter it should not be overlooked, however, that the value of the load on the meter at any given time can be readily calculated from the speed of the meter armature. The speed can be easily determined by counting the number of revolutions made in a given period of time, using a stop-watch.

The second award (5s.) is given to "ASTATIC," whose reply is given in somewhat shortened form below:—

The majority of meters fitted by supply companies are fairly accurate from  $1/20$ th of full load to 20 per cent. overload, and after this they commence to register slow, which is, of course, in the consumers' favour.

The reason for this depends upon the type of meter being used, so, as an example, we will discuss a Chamberlain and Hookham meter for direct currents with a 10-ampere rating, as this type of meter is extensively used. This meter is an ampere-hour meter of the mercury motor type. The current is led to and from the meter by two copper strips placed in a mercury bath, the bath being fixed in the field of a permanent magnet. Two discs are fitted on a spindle, the lower disc is immersed in the mercury, and the upper disc is free to rotate between the poles of a brake field, thus forming an eddy current brake. To overcome the fluid friction of the lower disc in the mercury, a correcting coil of a few turns of wire carrying the main current is wound round the brake field; from this it will be seen that as the load increases the brake field will become weaker, and the speed of the meter will increase. This is fairly accurate up to 20 per cent. overload, but as the fluid friction increases with the square of the speed, and the strength of the brake field is in proportion to the amount of current traversing the correcting coil, it will readily be seen that at 50 per cent. overload the meter must read slow, because the fluid friction is nearly twice what it was at full load. The supply company would have no indication that the load had been increased, unless a maximum demand indicator were fitted.

**Answer to No. 1413.**—"Koil" calls our attention to the fact that in his reply to this question, published on page 562 of our last week's issue, the formula for the number of armature bars at the beginning should have the speed given in revolutions per minute, instead of revolutions per second.

## FUTURE OF LONDON'S ELECTRICITY SUPPLY

THE Special Committee of the London County Council which has had in hand the question of London's future electricity supply has now somewhat elaborated its detailed proposals placed before the Council in July, and given in *ELECTRICAL ENGINEERING* for July 30th, p. 428. Briefly, the scheme is that an authority shall be constituted to develop a new undertaking dealing with the whole of the supply to London and a considerable area outside, the undertaking being subsequently leased to a company which is to provide part of the capital required for extensions. This leasing company is to work under the general control of the new authority under certain definite restrictions, including the limitation of dividends. The object of the present report, which was presented to the London County Council on Tuesday, was to recommend definitely that the Council should promote a Bill next session to give effect to the proposals.

Since the previous report, the opportunity has been taken by the Committee, as notified in our columns, of meeting representatives both of the London boroughs owning electricity works, and of the municipalities similarly situated in the Greater London area, affected by the proposed scheme, and it is probably as a result of these conferences that the Special Committee deals first with suggestions that the present is not the most opportune time for dealing with this matter. On this point the Committee at once definitely expresses itself satisfied that the scheme constitutes the most practicable method of arriving at a satisfactory solution of the problem, and that the exceptional conditions which obtain do not affect adversely the advantages of the scheme presented. Furthermore, it is pointed out that full liberty of action will be left to the Council in dealing with the matter after the Parliamentary powers have been obtained, as the Bill asks for a time-limit of five years, and expenditure under the Bill would not, of course, be sanctioned unless the conditions were favourable.

The details of the scheme which the Committee ask the Council to place before Parliament follow practically without modification the outline given in our issue for July 30th. The most important modification, perhaps, is that whereas originally it was suggested that the proposed new company should find one-third of the capital required for new works, and the new Authority the other two-thirds, it is now asked that the extent to which either party should participate in the financial responsibility shall be left to agreement according to circumstances.

It is proposed to insert in the Bill clauses for the protection of consumers through the medium of a scale of maximum charges which can be revised by the Board of Trade from time to time upon the application of either the Authority or the company. In addition, power is to be given to the Authority to take action generally for the protection of the interests of retail and bulk consumers. In order to enable the Authority to exercise an effective watch over the interests of the consumers it is proposed that it should be vested with the general powers relating to electricity supply which are now vested in the County Council, and in the local authorities outside the County area. With regard to relations between the existing undertakings, the Bill will provide for the Authority to advance them money to enable them to take bulk supply, lay down standard networks, &c., and, in order to secure some degree of continuous co-operation and inter-working, certain general powers of approval in regard to extensions of existing undertakings are to be conferred upon the Authority subject to appeal to the Board of Trade. Further, Local Authorities who are authorised distributors in the area are to be required to take any additional power required by them from the new undertaking, provided it is shown to the satisfaction of the Board of Trade that it would be more profitable to do so than to extend their own plant. The only compulsory powers which it is proposed to confer upon the new Authority are, it is pointed out, designed to prevent individual supply authorities from incurring capital expenditure in laying down plant and other works which, in the opinion of the Board of Trade, are definitely unsuitable to an ultimate scheme of uniformity of supply throughout the Greater London area.

The Finance Committee of the County Council supports the proposal, and foresees by its adoption a diminution in the difficulties attending the extension of a number of comparatively small, and in some cases unprofitable concerns, and at the same time the avoidance of claims for severance which would undoubtedly arise in the event of the Council purchasing the companies' undertakings in the County of London only under the existing powers. The Finance Committee points out that the estimates show a capital total

expenditure of about £5,000,000 for the first period of five years, and further sums subsequently at the rate of about £1,000,000 per annum. As, however, five years are to be asked for after the passing of the Act in which to bring the scheme into operation, it would be possible that, if the conditions were temporarily adverse, no heavy capital expenditure would be incurred until nearly 1920. Also, it is pointed out that if no company comes forward, the whole scheme drops. Finally, it is suggested that if during the early stages of the Parliamentary proceedings, which are estimated to cost about £17,000—should the scheme be finally passed—it is foreseen that there is little chance of carrying the matter to a successful issue, it would be the best policy not to continue with the promotion, and so save a considerable sum in Parliamentary expenses.

## LUNDBERGS' ELECTRIC-LIGHT SWITCHING COMPETITION

BY arrangement with Messrs. A. P. Lundberg & Sons, we are placing space in our next four issues at their disposal for the publication of the details of their new electric-light switching competition. These particulars will be published in *ELECTRICAL ENGINEERING* only.

The object of the competition is to extend the knowledge of the various methods of electric-light switching; in fact, the same object as the publication of the small book on this subject reviewed in our last issue.\* Competitors will, in fact, be assumed to have a more or less intimate knowledge of the contents of this book. Three sets of question papers will be set: preliminary, intermediate, and advanced; competitors are invited to select one of these three, and a date will be fixed for answers to be sent in to this office. First and second prizes (in money) will be awarded in each of the three grades, and certificates will be issued to all competitors whose efforts show a proper acquaintance with the subject. Messrs. A. P. Lundberg & Sons have appointed Mr. W. Perren Maycock, the author of the book referred to above, to examine the papers.

The competition is open to all of our readers, whatever their status, and it may be cordially recommended to them. No fee is required, and all that it is necessary to do is to read the book upon which the competition is based, to read the rules of the competition in our next issue and the question papers in the next three issues, and to send in answers to one set of these. The answers can be worked at home with the help of the booklet. There are no troublesome "coupons" to fill in, and the competition is as open to those who commence reading *ELECTRICAL ENGINEERING* today as to those who have read it for seven years. Another point that will appeal to many of our readers is that competitors will be free to enter the competition under a *nom-de-plume*, so long as they send their name and address as a guarantee of good faith. In the last electric-light switching competition held by Messrs. A. P. Lundberg & Sons, competitors included members of the Illuminating Engineering Society, associate members, graduates, and students of the Institution of Electrical Engineers, as well as contractors, foremen, and wiremen. They hailed from all parts of the United Kingdom:—from Dublin to Clacton and from Glasgow to Southampton, and some wrote from Ceylon, Barbados, Chili, South Africa, and India.

The preliminary grade questions will deal with the connection of the simpler circuits, and the switches and other accessories used therein. The intermediate grade paper involves a more intimate acquaintance with all except the most complicated switching circuits and a certain amount of deductive work on the part of the competitor in working out problems that are not immediately obvious. The advanced grade paper calls

\* *Electric Lighting Connections*. Third Edition (25th thousand). Obtainable from the Kilowatt Publishing Co., Ltd., 203, Temple Chambers, London, E.C., Post Free 7d.

for a wider and more general appreciation of the whole details of the subject than the preliminary and intermediate papers, and competitors may be asked to devise additional modifications, to sketch new diagrams and to work out new arrangements of circuits for special cases.

Quite apart from the desire to gain prizes, many will find it both interesting and instructive to work out the problems given in the papers. It is always satisfactory to feel that one has solved a "knotty" problem not immediately obvious, especially if in doing so information may be acquired which has not been hitherto possessed. An engineer or contractor who has studied the papers sufficiently to be able to answer all the questions will feel in a position to tackle the most troublesome problem as to the arrangements of lights and switching which the most exacting client may wish to impose on him; and the wireman who has competed with success will undoubtedly be able to class himself among those who possess technical knowledge as well as mechanical aptitude, so that he may advance rapidly to the best jobs and the best positions.

It may be said with truth that the subject of Electric-Light Switching is really a very important branch of electrical work, the scope and possibilities of which will greatly surprise those who investigate the subject for the first time.

## POWER RATES AND 'UNDUE PREFERENCE'

A DECISION given in the Court of Appeal last Thursday should put central station engineers and managers on their guard when framing tariffs for electricity supply. It should be recognised that the sole justification for differential tariffs is to permit of the charge for supply being varied approximately as the cost of the supply to the undertaking.

The appeal in question was against a decision given by Mr. Justice Sargant last May in the case of the Attorney-General, at the instance of the Long Eaton Gas Co. v. the Long Eaton Urban District Council (ELECTRICAL ENGINEERING, May 14, p. 266). In September, 1911, the Electricity Department of the Long Eaton U.D.C. issued a circular limiting the benefit of the cheapest rates for power (3d. per unit for all consumption over 6,000 units per quarter) to those consumers who took current for all their lighting as well as for power. For consumers taking electric power only, and not using electric light to the exclusion of other methods of illumination, the sliding scale of charges stopped at 1d. per unit for all units above 4,000 per quarter.

This, it was alleged, constituted an infringement of Sections 19 and 20 of the Electric Lighting Act of 1882, which read as follows:—

19. *Obligation on Undertakers to Supply Electricity.*—Where a supply of electricity is provided in any part of an area for private purposes, then, except in so far as is otherwise provided by the terms of the licence, order, or special Act authorising such supply, every company or person within that part of the area shall, on application, be entitled to a supply on the same terms on which any other company or person in such part of the area is entitled, under similar circumstances, to a corresponding supply.

20. *Charges for Electricity.*—The undertakers shall not, in making any agreements for a supply of electricity, show any undue preference to any local authority, company, or person, but, save as aforesaid, they may make such charges for the supply of electricity as may be agreed upon, not exceeding the limits of price imposed by or in pursuance of the licence, order, or special Act authorising them to supply electricity.

Mr. Justice Sargant had given his decision against the Long Eaton Council.

Before the Appeal Court, Mr. Vesey Knox, K.C. (who appeared for the Urban District Council, with Mr. Martelli, K.C., and Mr. Courthope Munroe, K.C.), argued that Mr. Justice Sargant was wrong in practically ruling out of consideration, in the arrangement of a tariff, the element of competition. The Court, however, which consisted of the Master of the Rolls and Lords Justice Kennedy and Swinfen-Eady, held that this was not a material point, and that the Council was called upon to justify the circular. Lord Justice Kennedy remarking that if this was not undue preference, he did not know what was. Lord Justice Swinfen-Eady put the case of two factories both taking the same quantity of energy for lighting and power under

identical conditions, but one, in addition, having either a gas engine or a few gas burners. Why should the latter one not have the same terms as the former? Mr. Martelli further argued that the Act of Parliament was intended to restrain a supply authority from doing a certain thing, and not to restrain it from threatening to do it, and pointed out that the circular had never been acted upon. The Court ruled, however, that, as the circular had not been withdrawn, the judgment of Mr. Justice Sargant must stand, and dismissed the appeal with costs. They regarded it as fairly obvious that the differentiation of charges in question was in contravention of the Electric Lighting Acts, and displayed considerable impatience at the length of Counsel's arguments, the greater part of which they characterised as irrelevant.

We cannot help feeling that no good has been done to the electricity supply industry by bringing the matter to the Court of Appeal, and, in fact, several of the leading men in municipal electrical circles have expressed to us the opinion, which we fully share, that the Long Eaton Urban District Council should have withdrawn the offending circular at the outset, and should never have allowed the case to be brought into Court at all.

## ROYAL NAVAL DIVISION

THE detachment which the Institutions of Electrical, Civil, and Mechanical Engineers were asked to provide for the Royal Naval Division is now complete, and no further men are required. We give below the names of the members of the Institution of Electrical Engineers who have been allocated to the Signal Company which is commanded by Capt. G. H. Spittle, A.M.I.E.E., and Lieut. H. Dobell, A.M.I.E.E.:—

*Member.*—A. E. Loos.

*Associate Members.*—G. C. Allingham, A. Arden, S. P. Barnes, L. C. P. Bellamy, C. Bollam, G. F. Boxall, W. B. Boyd, C. A. Brearly, H. A. Brimelow, W. J. I. Casewell, J. F. Clunas, H. A. Edger, E. A. Edwards, E. P. Elwin, S. K. Ferrier, E. F. French, J. W. Griggs, E. J. Harper, D. Harrop, R. P. Hulton, E. W. Kay, J. H. Murray, H. H. Pearson, P. C. Pocock, W. R. W. Poole, L. H. Pratt, A. H. Read, T. N. Riley, B. H. Smith, H. A. Tulloch, A. G. Watson, W. Whitney, G. E. E. Williamson, A. C. Wilmot, and A. E. G. Wood.

*Associates.*—A. L. Annison.

*Graduates.*—H. J. Booth, C. A. Grut, T. J. Hornblower, C. E. Monks, G. Ollier, F. C. Platt, W. G. Stokes, E. Wyatt.

*Students.*—G. G. Baker, F. L. Ballard, A. Bannister, E. Barlow, L. W. E. Baxendale, E. J. Billington, B. L. Bishop, H. Booker, C. W. Bostock, C. W. Boxall, A. S. Bruce, J. H. Burchett, A. S. Carr, R. M. Clark, J. P. Clifton, H. H. Curtis, E. A. Deacon, J. A. Donald, M. O. F. England, E. A. Gordon, E. F. James, B. H. Leeson, C. E. Maguire, R. O. Martin, B. E. G. Mittel, E. L. Morgan, P. Morrell, A. H. Ogden, J. Page, J. D. Peattie, A. C. Roberts, J. N. Robertson, E. J. Shuter, E. Simkiss, W. G. Spencer, C. A. Stephens, H. J. Stone, H. C. Vereker, C. S. Williams, P. Wrigley, W. Young, and H. S. Housden.

In addition the Signal Company also contains four Associate Members and eight Students of the Institution of Civil Engineers, and seven Associate Members and three Graduates of the Institution of Mechanical Engineers.

**Temporary Commissions in the Royal Garrison Artillery.**—The Institution of Electrical Engineers has been asked to submit names of suitable members for temporary Commissions in the Royal Garrison Artillery. Candidates should be well educated, between the ages of twenty and thirty, and with practical mechanical as well as electrical training. Specially good officers are required. Applications should be sent on a foolscap sheet of paper to the President, Sir John Snell, stating age, nationality, whether single or married, and details of education, mechanical and electrical training, and military experience, if any.

**The Ilford Case.**—We understand that the main point to be fought in the action by the Ilford Gas Co. against the Ilford Corporation is as to preferential charging to consumers whose premises are lighted entirely by electricity. The Gas Co. also made a charge as to dealing in fittings without powers, but apparently the Council has consented not to continue to do this. The I.M.E.E. has circularised its members as to their willingness to give financial assistance in fighting the case. The Salford Corporation has referred back to the Electricity Committee a proposal to contribute £20, and the Town Clerk has been asked to prepare a report on the matter. The short facts of the case were given on p. 400 of our issue of July 9th.

**Municipal Wiring.**—The Incorporated Municipal Electrical Association is inquiring as to the extent to which its members would contribute towards the cost of promoting a bill for conferring hiring and wiring powers upon those local authorities desiring them. The possibility of promoting such a joint bill was suggested at the annual convention in Birmingham this year.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Some doubt exists as to what will be the position of the English staff of the Constantinople Co., now that war with Turkey has broken out. It has been taking from ten to fourteen days to obtain news from Constantinople, and the last reports received by the Company over here from their staff date back about three weeks. Evidently there had been reason to expect trouble long before that, for about six weeks ago an order was given that all the wives and children of the English staff were to be sent home, and, as a matter of fact, they arrived here about a month ago. There had been financial trouble as well, and a money famine, but it may be inferred that the trouble anticipated was not on this account alone. The telephone service has been going on quite well, and, in fact, at the time of the last report, new lines were being put up by the Company. The work of the con-

tractors in carrying out additions to the exchange, &c., was, however, completely stopped owing to shipping having ceased. In any case it would have been hopeless to have tried to get material out, as practically all that was required was regarded as contraband of war. The operating staff of the exchange is all Turkish, but the Traffic Manager, Miss Minter, who is still in Constantinople, is an Englishwoman, and of course the greater number of the Company's officials on the engineering side are also English, and include a number of former employees of the National Telephone Company.

The Turkish lines crossing the Russian frontier are down, but the Eastern Telegraph Co. deny that the cables between Tenedos-Syra and Tchesme-Syra are interrupted.—The Constantinople-Odessa cable is interrupted.—Communication to S. Domingo is restored *via* "Key West-Jamaica," but telegrams to places beyond La Romana will be probably sent by post.—The Peruvian Administration will only accept messages in plain Spanish, English, and French for wireless stations at Masisea, Orellana, Requena, Itaya, and Iquitos, and the use of cipher is prohibited.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Oct. 29th, 1914

A full list of those of electrical interest among these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of invention; from abroad.

19,919/13. **Current Transformers.** F. COATES, J. MIRREY and A. REYROLLE & Co., LTD. Current transformers for actuating Merz-Price protective gear with one primary turn and a core made up in sections with air gaps between them. (Six figures.)

21,672/13. **Wireless Telegraphy.** MARCONI'S WIRELESS TELEGRAPH Co. and R. N. VVYAN. A method of connecting up condensers into a bank, which ensures that the oscillation constants of all the units are practically the same. (Two figures.)

22,406/13. **Telephones.** WESTERN ELECTRIC Co., G. H. NASH and B. B. GRACE. Details of construction of hand combination telephone sets with stamped metal bodies. (Four figures.)

22,416/13. **Water Heaters.** A. F. BERRY. A system of electric water heating with one or more heating chambers communicating with a central storage vessel arranged so that the latter can easily be inspected and cleaned out without disturbing the supply of water from the heating vessels. Contacts controlling the heating circuit are interlocked with the draw-off cock of the storage tank, so that it cannot be cleaned out or inspected until the current is cut off. The heating elements are easily replaced, and the heating vessels are easily detached from the storage vessel. (Three figures.)

24,688/13. **Demagnetising Switches.** T. L. JONES. Switches for demagnetising the material held by magnetic clutches by the method of continued reversals, consisting of a double multiple contact rheostat with stops connected alternately to points on resistances in both sides of the circuit and two contact arms connected to the clutch coil. As these travel over the contacts the current is reversed and diminished at each step. (One figure.)

25,607/13. **Storage Battery Plates.** E. H. NAYLOR. Battery plates made of three superposed grids fixed together with the outer ones filled with acting material and the centre one left unfilled and cut away at certain points, so as to allow of free circulation of the electrolyte. (Six figures.)

29,581/13. **Electric Bells.** W. J. BLENHEIM.—Large electric bells in which a heavy external hammer, after making and breaking contact in the usual way, is free to swing back any distance. During its return swing towards the bell, contact is again made and the stroke accelerated. (Five figures.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** TAYLOR [Frequency changing] 15,729/13; B.T.-H. Co. and WEDMORE [Leakage protection] 25,598/13.

**Dynamos, Motors and Transformers:** HEENAN & FROUDE, LTD., and WHEAL [Air filters] 23,281/13; FAYE HANSEN [Choking coils] 25,695/13; SIMMONS [Regulation of variable-speed alternators] 25,919/13; HALL and RILEY [Motor control] 16,319/14.

**Electrometallurgy and Electrochemistry:** WALTISPURGER and RIVOAL [Electroplating] 23,241/13; JENKINS, PATINSON, and WELLESLEY [Electrolytic cells] 25,415/13.

**Switchgear, Fuses and Fittings:** NORBALLE and LAWSON [Motor starters] 23,127/13; COLLINS and OPTALYTE, LTD. [Motor-car lamps] 23,543/13; BONNELLA and BONNELLA [Switches] 26,635/13; NORBALLE and LAWSON [Multiple contact switches] 17,988/13.

**Telephony and Telegraphy:** MARCONI'S WIRELESS TELEGRAPH Co., LTD., and FRANKLIN [High-frequency alternators] 23,557/13.

**Traction:** WILLS and SYKES [Insulated rail joints] 19,603/13.

**Miscellaneous:** HADDAN [Stewart-Warner Speedometer Corporation] [Magnetic speed indicators] 22,048/13; LANCASHIRE DYNAMO & MOTOR Co., McLEOD and WHITMORE [Crane brakes] 22,435/13; WESTERN ELECTRIC Co. [Woodward, W.E. Co., U.S.A.] [Welded contacts] 26,609/13; BERGTEIL [Oscillating electric fans] 29,449/13; WILLIAMS [Torches] 65/14; A. G. BROWN BOVERI ET CIE [Turbine regulation] 3,893/14; CASELLA [Electrode-making machines] 14,582/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Ignition:** BETHENOD [Magnetos] 15,576/14.

**Miscellaneous:** DONATH [Discharge tubes] 20,374/14; BRÜCK [Magnetic separators] 20,551/14.

### Applications for Suspension of Patent's

20,922/12, **Magnetic Clutches,** VULKAN MASCHINENFABRIKS A.G., and 23,150/12, **Switches for Magnetic Clutches,** E. C. R. MARKS [Vulkan Maschinenfabrik A.G.]. The application by Glenfield and Kennedy under these patents has been refused.

### Expiring and Expired Patents

The following Patent's expire during the current week, after a life of fourteen years:—

19,988/00. **Insulating Rail Joints.** W. R. SYKES, A. P. JOHNSON and C. J. COOKE. An insulating rail joint with the fish plates divided into two parts insulated from each other and held together by insulated bolts.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos, Motors, &c.:** LANCASHIRE DYNAMO & MOTOR Co. and R. S. McLEOD [Boosters] 15,811/03 and 14,495/04. **Ignition:** MARCONI'S WIRELESS TELEGRAPH Co., LTD., and PRIDDLE [Coils] 15,910/06.

**Incandescent Lamps:** SOC. FRANCAISE D'INCANDESCENCE PAR LE GAZ (SYSTEME AUER) [Manufacture and mounting of metal filaments] 12,720 & 24,211/08 and 11,149/09; C. TREZEN [Titanium filaments] 14,852/08.

**Telegraphy:** R. K. GRAY [Submarine cables] 15,054/08.

**Traction:** W. MORRISON [Petrol-electric vehicles] 16,331/09; DALZIEL'S CONSTANT VOLTAGE PATENTS, LTD., and J. DALZIEL [Train lighting] 16,645/09.

**Miscellaneous:** H. W. LAKE [Coal cutters] 16,323/07; ZHANIEL [Stage lighting effects by high-frequency currents] 16,309/09; F. BURKS [Electric massage apparatus] 16,405/09; A. G. KOEHLIN [Loom lighting] 22,125/09.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### "MAGNET" ELECTRIC FIRES

SEVERAL new patterns of their "Magnet" electric fires have been introduced by the General Electric Co. (67 Queen Victoria Street, E.C.) since they first commenced the manufacture of these appliances last year. In addition to utilitarian patterns in polished brass and iron, a number of more ornamental designs have been prepared, such as

FIG. 1.—DRAWING-ROOM PATTERN.

that shown in Fig. 1. Another new design is the circular heater seen in Fig. 2 for clubs, hotels, &c. It will be remembered that the heating element consists of a number of wire coils laid in parallel slots in a grooved slab of fire-proof material, the whole face of which glows when the fire is on. Any coil can be very easily replaced, and, as they are

FIG. 2.—CIRCULAR CLUB AND HOTEL PATTERN.

in parallel, the burning-out of one does not affect the others, which are separated from one another by substantial insulating walls. Double break switches are used, completely isolating the elements, so that there is no risk of shock when replacing them. A substantial wire guard is placed over the elements, and other notable features include the use of a spiral form of terminal block, taking all strain off the conductors, and the provision made at the top of the fire for fixing a trivet by which water may be boiled or food kept hot.

### HALF-WATT MOTOR CAR LAMPS

THE announcement is made in a new leaflet issued by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), that Mazda half-watt lamps are now made at Rugby in sizes and special forms for motor-car head-lamps. The advantage of these lamps, in being twice as efficient as the ordinary metal-filament lamps now

in use, and about eight times as efficient as the old carbon lamps, is of great importance, and should lead to their extensive adoption. This new small half-watt lamp has the same leading characteristic as the large half-watt lamps in that a helical drawn-wire filament is used in a bulb contain-

HALF-WATT MOTOR-CAR LAMP (FULL SIZE).

ing an inert gas, which enables it to be run at a high temperature without blackening the bulb, as will be seen in the illustration. These lamps have the filaments arranged in a very compact form, so that they focus well in existing head-light mirrors, and are on the market in the following sizes:—20 and 32 c.p. for 6 volts; 32 c.p. for 8 volts; and 50 and 100 c.p. for 12 volts.

### A HALF-WATT STREET LANTERN

WITH the object of obtaining a maximum candle power between  $10^\circ$  and  $20^\circ$  below the horizontal, with a comparatively rapid falling away in candle power from this point towards the vertical and the horizontal, the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have introduced the new patent street-lighting unit (Patent No. 21,485/12), shown in section in Fig. 1, and how well this object is attained is shown by the polar distribution curve in Fig. 2.

The lantern consists of heavy copper spinnings, secured to

FIG. 1.

FIG. 2.

an internal mild steel spider, to which the lamp-holder is also attached. It is so arranged that by the removal of one nut the upper spinnings can be detached, giving free access to the holder, &c., for wiring. The spider also forms a gallery which holds the reflector in the correct position relative to the lamp. The globe is secured to a copper ring by means of clips held by screws, and this ring is secured

to the lantern frame by three spring latches, so that the globe may be easily removed or inserted, and at the same time is quite secure when in position. Owing to the special form of construction, whereby the top spinning can be removed when the lantern is in position (either on a chain or attached to a bracket), easy access is gained to the interior for wiring. When not connected to a rigid tube it is intended that the leads should be carried in beneath the detachable spinning, which obviates the necessity of employing a weatherproof hood with the attendant difficulties of wiring, &c. The unit embodies an upper reflector and a lower deflector, to catch the excess rays which would fall within a zone of  $0^{\circ}$  to  $50^{\circ}$  and turn them into a direction of about  $15^{\circ}$  to the horizontal.

The standard finish of the lantern is black stove enamel, but other coloured enamels or polished copper finish can be supplied at slight extra cost over list price.

### DIMMER FITTINGS

A NOVELTY has been introduced by Simplex Conduits, Ltd. (Garrison Lane, Birmingham), in the shape of a two-light pendant fitting illustrated here, which is provided with a series parallel switch in the body of the fitting, by which

BEDROOM DIMMER FITTING.

one or both of the lamps can be turned on full or both turned on dim by putting them in series. This should be very useful in bedrooms and other situations. A two-light wall bracket on a similar principle is also supplied.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**METAL FILAMENT LAMPS.**—A well-arranged new price-list of Royal Ediswan drawn-wire tungsten filament lamps has been issued by the Edison & Swan United Electric Light Co., Ltd. (Ponders End and 123 and 125 Queen Victoria Street, E.C.). In addition to the ordinary standard lamps, a number of candle, tubular, and other special designs are listed. The list also contains full particulars of the "Downlight" lamps with helical filaments, and last, but not least, the Ediswan half-watt lamp.

**AUTOMATIC ELECTRIC LIGHTING PLANT.**—The "Lister-Bruston" system of automatic control of small generating sets driven by petrol or gas engines is described in an interesting pamphlet from R. A. Lister & Co., Ltd., Dursley. In this system the engine is started up when required by the dynamo acting as a motor taking current from the battery as soon as either the load exceeds a certain amount or the battery voltage drops below a certain amount, and stopped when these conditions are reversed. This is accomplished by suitable relays acting on a solenoid-type automatic starter. Thus not only is attendance to a large extent dispensed with, but the battery is charged exactly when required. Views are given of a number of houses where the plant is in use, and testimonials bear witness to its

reliability in action. The system has lately been installed at St. Mary's Convalescent Home, Clevedon, which was formerly lighted by gas. The gas is now used to drive the engine, and the gas consumption has been reduced by more than one half.

### THE ENEMY'S TRADE

THE Incorporated Municipal Electrical Association has communicated with the municipal electrical undertakings of the country offering assistance in endeavouring to arrange for better supplies in this country of goods hitherto obtained from Germany and Austria. In this way it is hoped to obtain information which may lead to co-operative purchasing, and so secure better terms, or which may enable the Association to indicate the magnitude of the demand and encourage British firms to take up manufacture.

In connection with the campaign undertaken by the Board of Trade to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board have received a large number of inquiries for names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war. Special arrangements have been made for dealing with the inquiries, and lists are being prepared and circulated of articles which inquirers desire (a) to purchase, and (b) to sell. The third list, in which is incorporated the first and second lists, was published on Oct. 14th; the fourth list, which is a supplement to the third list, is now ready, and may be obtained, together with copies of the third list, on application to the Branch. Firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

The new list of articles which inquirers desire to purchase includes:—Bioscopes and accessories, porcelain and other insulators, pocket lamps and cases, lenses and batteries therefor, arc lamp carbons, conduits and fittings, commutator segments, dry cells, magnetos, insulating links for switches, Nernst glowers, steatite, lamp bulbs, miner's lamp dome glasses, arc lamp globes, metal filament lamps, motor-car lamps, lamp caps, and mica. The list of articles which inquirers desire to sell includes electrical apparatus generally, and in particular fittings and tungsten. The goods in respect of which names have been received of firms abroad open to purchase include telephone cables, arc lamp carbons, bells and pushes, cables, D.C. dynamos, fittings, incandescent lamps, pocket lamps, Roentgen ray bulbs, and telegraph apparatus and supplies.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Atherton.**—One 250-kw. single-phase transformer. Borough Electrical Engineer. Nov. 18th.

**Blackpool.**—One 1,500-kw. turbo-alternator, water-tube boiler, &c. Borough Electrical Engineer. Nov. 19th.

**Croydon.**—Electrical pumping plant at sewage disposal works. Town Clerk. Nov. 17th.

**Finchley.**—A number of mains extensions are to be carried out at an estimated cost of about £200.

**Russia.**—In a report from H.M. Consul-General at Moscow, it is stated that with the development of municipal institutions in Russia, there is a great field for contractors capable of installing, among other things, electric light and tramway plant. Hitherto German firms have invariably obtained such contracts, mainly, it is said, owing to the assistance given by the German bankers, which has enabled the manufacturers to give exceptional credit facilities.

**Skipton.**—Mr. W. Emmott, of Halifax, is advising the Council with regard to an electric lighting scheme.

**Stoke-on-Trent.**—A loan of £30,000 is to be applied for. Of this, the sum of £17,000 is for extensions, and the remainder to meet a bank overdraft.

**South Africa.**—Turbo-generators, switchgear, boiler-house plant, and cables are required by the Port Elizabeth Council. Agents, Davis & Soper, 54 St. Mary Axe, London, E.C. Tenders by Nov. 26th.

#### Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Barnet.**—New infirmary. Clerk, 1 Well House Lane.

**Barrow-in-Furness.**—Public library. Town Clerk.

**Birmingham.**—Extensions to West Heath Hospital (£8,660).

**Horsham.**—Isolation hospital. £3,000.

**Wigan.**—Extensions to public baths. Town Clerk.

#### Miscellaneous

**Accrington.**—It is proposed to light the Burnley Road by electricity.

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Barrow-in-Furness.**—The tender of the B.T.H. Co. for a 2,000-kw. turbo-alternator has been accepted at £6,718. The turbine will be of the four-stage type coupled to a 2,500-k.v.a. three-phase 50-cycle 6,600-volt 3,000-r.p.m. alternator and exciter, with Cole, Marchent & Morley surface-condensing plant. Delivery in eight weeks.

**Bury.**—The following tenders have been accepted:—Two 250-kw. transformers, Ferranti, Ltd.; maintenance of storage battery, Electrical Power Storage Co.

**London: G.P.O.**—A six months' contract for the supply of Osram lamps has been secured by the General Electric Co.

**New South Wales.**—The Government have accepted the tender of the Brush Electrical Engineering Co. for generating plant, condensers, and auxiliaries, for the Albury Electricity Works.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £52 10s. to £53. (Last week the same.)

**"Tucker" Switches.**—In order that their well-known switches shall be easily recognisable, J. H. Tucker & Co. (King's Road, Hay Mills, Birmingham) mark all the porcelain bases of their tumbler switches with their registered word "Telac."

**Reductions in Price.**—Morris & List r (London), Ltd. (3 and 4 Palace Chambers, Bridge Street, Westminster), announce that they are making a general reduction in the prices of their drilling and grinding machines, with a view to securing as much as possible of the trade which formerly went to Germany.

**"Woolwich" Tape.**—Siemens Bros. & Co., Ltd. (Woolwich), announce that they are placing on the market an improved type of "Woolwich" insulating tape of a high quality, entirely free from pinholes. They will be pleased to send samples to electrical contractors on request.

**Canadian Agency.**—An agent in Ontario wishes to represent a British manufacturer of electrical plant. The name is on file at 73 Basinghall Street, E.C.

**Liquidations.**—Stella Signs, Ltd., is to be wound-up voluntarily, and Messrs. A. C. Hutchins, 11 Pancras Lane, E.C., and V. G. Morris, Wardrobe Chambers, Queen Victoria Street, are liquidators. A meeting of creditors will be held at 11 Pancras Lane, E.C., on Wednesday, Nov. 11th, at 11.30 a.m. It will be remembered that Venner Signs, Ltd., recently entered an action against Stella Signs, Ltd., for alleged infringement of patents, but, as we notified a short time ago, the action was settled out of Court.

Mr. W. Schmahl, Managing Director of the Armorduct Manufacturing Co., Ltd., has changed his name to W. Ratcliffe-Small.

Mr. J. J. Easton has joined the Board of Directors of Siemens Bros. & Co., Ltd.

**Contraband of War.**—The Government has issued a further notice proclaiming unwrought copper, aluminium, and motor vehicles of all kinds to be absolute contraband, whilst in the list of conditional contraband articles is included material for telegraphs, wireless telegraphs, and telephones. The component parts of warships, which would presumably include the electrical equipment, are also declared absolute contraband. The export of searchlight carbons has already been prohibited, as well as signalling lamps operated by electricity and capable of being used for signalling Morse or other code.

### LOCAL NOTES

**Barrow: Supply to Vickers.**—In reference to the note in our "Tenders Invited" column last week as to the supply to Messrs. Vickers, this is to be increased from 1,040,000 units to 5,000,000 units per annum for a period of three years, with a guarantee of 3,000,000 units per annum for a further period of two years. The terms of payment previously have been that the amount paid by Messrs. Vickers shall be not less than 10 per cent. on the cost of the mains, namely £1,400, whilst under the new agreement this figure is to be altered to 5 per cent. on the cost of the whole plant necessary to supply Messrs. Vickers, namely, £13,000. Under the new scheme the revenue for Messrs. Vickers will be between £3,000 and £4,000 per annum. This extra supply from the Corporation is not in substitution of, but supplements, the supply which Vickers obtain from their own large generating plant.

**Belfast: The Extension Scheme.**—At the meeting of the Corporation on Monday, the following resolution was passed:—"That, considering the difficulty at the present time of obtaining money at a reasonable rate, the Council be recommended to postpone the erection of new electricity generating works, and, in order to meet the requirements of the ensuing three years, to make such alterations and additions to the plant in the existing works, provide and equip the necessary sub-stations, and provide and lay cables, the total cost not to exceed £25,000."

**Birmingham: Electricity Staff and the War.**—No less than 147 of the staff and workmen of the Electricity Department are on active service, and allowances are being made to them in accordance with the resolution of the Corporation. The total amount being paid in this way is at the rate of £4,500 per annum.

**Chester: The Water-Power Works.**—At the last meeting of the Electricity Committee, Mr. S. E. Britton, City Electrical Engineer, reported that on the basis of the first twenty-three weeks' working of the Water-Power Electricity Works, the annual profit will be about £4,480, compared with the estimate of £3,485.

**Dudley: Sale of Electricity Undertaking.**—The Borough Treasurer has prepared a report dealing with the finances of the late electricity department. The total capital expenditure was £106,183, of which £3,960 was met out of revenue. The rates have contributed £2,000 towards the upkeep of the undertaking, and at the date of sale to the Shropshire, Worcestershire, and Staffordshire Electric Power Co. there was a deficiency of £10,226. The Company has paid the Council £3,762, which is the capital expenditure in excess of loans sanctioned. There is a balance of £60,872 payable by the Company in instalments, and £4,050 has been paid as an agreed sum to clear up accounts to March 31st. The sum of £6,745 has been paid on account of revenue deficit at date of transfer: £633 to provide for liabilities at the time of transfer, and a further £4,352 is payable by annual instalments with interest to complete the transfer.

**Fleetwood: New Plant.**—A new 550-kw. turbo-generator set supplied by James Howden & Co., of Glasgow, was put in operation at the Council's Electricity Works last week. When the Council took over the works of the old Fleetwood Co. in 1909, the capacity was 345 kw. An extension in 1911 increased this to 645 kw., whilst the new generating set just installed increases the capacity of the works to 1,195 kw.

**London: Hammersmith: Supply of Cables.**—The Council's contract with the Western Electric Co. for the supply of cables expired in September, and the Engineer has reported that, having regard to the present market conditions, he has, in issuing invitations to tender, provided for quotations for (1) the supply of definite quantities, and (2) a supply as required for a period of three months.

**Reduced Lighting in London.**—A further order regarding the reduced lighting of London has been issued, applying from November 1st for two months. In streets, squares, and bridges some lights must be extinguished so as to break up conspicuous groups, and the lights must be lowered or made invisible from above. Sky signs, &c., and powerful shop front lights are prohibited, and inside lights of shop fronts must be reduced. Large lighted roof areas must be covered or have the lighting intensity reduced. In tall buildings most of the windows must be shrouded, though moderate lights may be left uncovered at irregular intervals. The lights in railway stations and along the water fronts must be masked, and the lights of tram-cars and omnibuses must be reduced and in crossing bridges completely obscured. Powerful motor-car lamps and the aggregation of flares in street markets are prohibited.

### SUMMARY

INQUIRIES which we have made show the effect of the war upon the loads of the electricity supply stations throughout the country. In many cases the output has benefited by increased power load, but lighting has decreased with but few exceptions. Load factors have improved. There are a few instances in which outputs have suffered seriously, but for the most part the effect has not been unfavourable (p. 584).

THE electrical equipment of a large battleship building in the United States for the Argentine is described (p. 585).

SOME aspects of the heating and cooking load from the central station engineers' point of view were discussed at a recent meeting of the "Point Fives" (p. 586).

FULL particulars are now published of Lundbergs' Electric Light Switching Competition. The value of the prizes offered has been considerably increased since the previous competition. The actual question papers will appear in our next three issues (p. 587).

THE London County Council decided on Tuesday by seventy-seven votes to seven to proceed with its Electric Power Bill. It is, however, anticipated that the opposition from existing supply authorities may be too strong to permit the Bill passing next session. We report at length a clever and spirited speech in opposition to the Bill by Mr. H. H. Gordon (p. 587).

A DEATH occurred at Greenwich power house of the L.C.C. tramways owing to contact with the neutral bar of a generator. Tests showed subsequently that the earthing of the neutral point of one generator

cannot be relied upon to keep the neutral points of others in parallel with it at absolutely zero potential (p. 589).

THE chairman's address of Mr. T. Roles to the Yorkshire Local Section of the Institution of Electrical Engineers dealt with the war and the Electrical Industry (p. 586).

SPECIFICATIONS were published last week at the Patent Office dealing with frequency raising by static transformers, insulated rail joints, air filters, high frequency alternators, and protective gear. A patent for electric winding plant control is opposed. Patents relating to sparking plugs and wireless telegraphy expire this week (p. 590).

A QUESTION relating to the running of rotary converters "inverted" is propounded in our "Questions and Answers" columns (p. 591).

A CONSIDERABLE scheme of linking up of dead ends, etc., is proposed for the L.C.C. tramways (p. 591).

WE give particulars of the telegraphic dislocation due to the war with Turkey.—The Pacific cable cut by the Germans has been repaired (p. 591).

TEN water-tube boilers and two 15,000 kw. turbo-alternators are required by the Manchester Corporation; cable at Stockton-on-Tees, Batley, Stoke-on-Trent and Willesden; switchgear by the L.C.C.; electric cranes in Spain, and electrical supplies by some railway companies.—An expenditure of £100,000 is contemplated upon electrical extensions at Cape Town (p. 593).

A DISPUTE has again arisen between the Sheffield Corporation and the local contractors. There is also some controversy between the Oldham electrical contractors and the Electricity Committee with regard to the hiring out of motors.—The Maidstone Borough Electrical Engineer has been asked to refund the £200 bonus paid in error.—The Derby Electricity Committee has insured against loss of profits from fire, explosion or electrical breakdown.—The question of the charge for current for cinematograph theatres is creating attention in Islington (p. 594).

THE Metropolitan Electric Supply Co. has decided to pay the dividend on the ordinary shares which was recently postponed.—A satisfactory report is issued by the Edison & Swan United Electric Light Co., but no dividend is declared on the ordinary shares (p. 594).

**Belgian Engineers.**—The Society of Engineers, at whose last ordinary meeting about twenty Belgian engineers were present, extend a cordial invitation to all Belgian engineers now in England to apply to the Secretary when they are in need of any information. Those who are unable to call are invited to send their names and addresses to the Secretary so that they may be in touch with their colleagues and receive invitations to the meetings. The offices of the Society at 17 Victoria Street, Westminster, are open daily from 10 a.m. to 4 p.m. (Saturdays, 10 a.m. to 1 p.m.).

(For arrangements for the week see page 588.)

## THE EFFECT OF THE WAR ON THE ELECTRICITY SUPPLY INDUSTRY \*

NOW that the war has been going on for three months, it is possible to review the effect it has had upon the output of the electricity works of this country. Speaking generally, there have been four factors which were bound to influence the demand for electric light and power to a greater or less extent. The first of these was the natural tendency, especially during the first weeks of the war, to economise in every direction, but although this might have affected the consumption for domestic electric lighting, it was more than counterbalanced by the large number of people who decided to forego their summer holidays and, in consequence, used more instead of less electric

STEPNEY LOAD CURVE.

Full Line, Oct. 20, 1914.  
Dotted Line, Oct. 21, 1913.

light at home. The lighting load in London and some other large towns has, however, been diminished to some extent during the past few weeks on account of the diminution of street lighting, and still more owing to the compulsory reduction in intensity of shop-front lighting, and the total drop varies from 5 to 20 per cent. as compared with last year, although this has been to some extent compensated for by the fact that the chief reductions have been on peak load, so that the load factor has improved in spite of the shorter hours of good load just after peak due to early closing. The Kensington & Knightsbridge Co., for instance, has experienced a diminution of 20 per cent. in the maximum load, but only  $4\frac{1}{2}$  per cent. in output. The power load has been increased in some localities and decreased in others, but those stations which have experienced increases have been in the majority. Clothing factories, practically all engineering works, factories of woollen goods and paper works have been working at high pressure and overtime and have, therefore, drawn more power from the central stations; one of the largest cases of increased output is at Barrow-in-Furness, where Vickers's works (as has been already mentioned in our columns) is to be supplied with an additional five million units yearly. On the other hand, the cotton industry has been depressed, so that at Bradford and in some of the Lancashire stations there has been a drop in the load.

Needless to say, it is the seaside towns which have suffered most from decreased output. In Brighton, for instance, in which the lighting load is the main source of revenue to the electricity works, the cur-

tailment of street lighting, outside shop and advertising lighting, and the illumination of the piers has had a serious effect, and other seaside watering-places have been affected in the same way, although the reduction is not to be measured quite in proportion to the illumination of the sea fronts, which present a dismal appearance after dark, owing to the blackening of the lamp globes by order of the Admiralty. Dover is an exception, as the municipal electricity works supply both the War Department and the Admiralty whose electricity requirements have gone up considerably. In Plymouth, on the other hand, there has been a decided drop in output owing to the restricted hours of lighting due to orders from the War Department. Southend generated 412,000 units last month as compared with 437,000 in October, 1913, but the maximum load has risen from 2,392 to 2,553 kw., and the load factor dropped from 27.2 to 24. This includes figures for the trams, the traffic receipts and mileage of which have gone down. The lighting restrictions are very severe, and further drop in output is expected.

Two districts where electric power consumption has increased greatly are Stepney and Poplar. In both cases the lighting load has dropped, but the power load has increased enormously. For the month of September the Stepney Borough Council sold 85,984 more units for power than in 1913 (the corresponding increase from 1912 to 1913 having been 81,011); lighting units, on the other hand, increased only by 4,354 for the month, compared with 42,369 for 1912 to 1913. The power increase is largely due to the number of clothing factories which are working overtime on Government contracts, and is well shown on the typical load curve which we reproduce below. The maximum load is practically the same, but the width of the morning and evening peaks has broadened enormously. The same phenomenon is observable in the neighbouring borough of Poplar, whose load curve for Oct. 30th we also reproduce.

POPULAR LOAD CURVE.

Full Line, Oct. 30, 1914.  
Dotted Line, Oct. 31, 1913.

The following information has been obtained from Lancashire in response to our inquiries:—

*Manchester.*—For the week ended August 1st there was an increase of  $10\frac{1}{2}$  per cent. in the output as compared with the corresponding week last year. The following week, August 8th, the increase had diminished to 5.1 per cent., by the week ended August 15th there was a 2.4 per cent. drop, as compared with last year, but for August 22nd the week's record showed a drop of 11.67 per cent. The following week, however, the output was practically the same as last year, and since then there has been a gradual increase. The falling-off has been entirely due to less lighting; apparently an increase in the general engineering load has made up for any loss from the cotton industry.

*Lancashire Electric Power Co.*—There has been a loss of

\* Among previous articles which have appeared in ELECTRICAL ENGINEERING are the following: "Germany's £14,500,000 Export Trade Analysed" (Aug. 13th), "The Effect of the War on the Electric Lamp Industry" (Aug. 20th), "The Effect of the War on Street Lighting" (Aug. 27th), "The Effect of the War on the Dynamo and Motor Industry" (Sept. 10th), and "Germany's Telegraphic Isolation" (Oct. 8th).

output in the supply to textile industries, but a recovery has already taken place. In other directions the output has not been adversely affected.

**Bolton.**—Here the textile trade has been also responsible for the extremely large reduction in output. During the three months, August, September, and October, the number of units sold was 366,167 less than the corresponding period of last year.

**Oldham.**—Both lighting and power have been considerably reduced.

**Stalybridge, Hyde, Mossley and Dukinfield.**—The output from the works of the joint Electricity Board has diminished about 30 per cent. since the war commenced, owing to the depression in the cotton trade.

**Ashton-under-Lyne.**—There has been a drop in lighting and also generally in power load, but this was compensated by fresh connections which had been arranged prior to the war, and the net result is a slight increase in the total output.

**Bury.**—The drop due to the cotton industry was fully compensated for by increased outputs in the woollen and paper industries.

**Accrington.**—Here the lighting and heating output has risen 18 per cent. and the power demand is about the same.

**Liverpool.**—The lighting output has somewhat decreased, but up to the present the total output has exceeded that of last year.

**Bootle.**—There has been an increase in both lighting and power, but not so great as would have taken place normally.

In many Yorkshire towns the increase in the woollen industry has resulted in an increase in load. Bradford, however, has suffered by the slackness in the cotton industry.

**Huddersfield.**—Both the power and lighting demands are showing very substantial increases; in fact, things are so prosperous that recruiting for the Army is very slow.

**Hullfax.**—The power output has risen 30 per cent.; the lighting has been affected by consumers' economies and the shutting down of the public arcs by order.

**Yorkshire Electric Power Co.**—Generally there has been a considerable increase in the use of supply for power, and the lighting business is going forward at the usual rate. The public are appreciating the advantages of electric power to meeting certain alterations in the working conditions caused by a disturbance of trade.

**Sheffield.**—There have been very large increases indeed in the demands for current for power purposes, as iron and steel works and other large works are running at full pressure on Government orders.

**Leeds.**—During the first few weeks the output decreased seriously, but after the third week conditions commenced to improve, although the demand has not yet quite reached the normal figure. There is, however, a considerable amount of work being done for the War Office and Admiralty, which has, to some extent, neutralised the effect of the war on other branches of trade.

**Bradford.**—This town is very much dependent on the cotton trade and also manufactures largely for export to Germany, so that the power load has fallen off very much, and the tramway load has dropped in sympathy, owing to some mills having been closed three or four days a week. There has, in consequence, been a drop both in maximum loads and output.

The following information has been obtained from other towns and districts:—

**Newcastle-on-Tyne Electric Co.**—Speaking generally, the war has not materially affected either the lighting or power outputs. Increases in some directions have compensated for the decreases in others.

**Sunderland.**—The power load has dropped, due to the normal fluctuation of the shipbuilding and allied trades, but there has been no reduction attributable to the war. The lighting load has gone down about 10 per cent.

**Southampton.**—All outside shop lighting has been stopped by order. The increase in output is 5 per cent., as compared with 15 per cent. last year, and 25 per cent. in 1912. This has, however, been probably due to local conditions rather than to the war.

**West Hartlepool.**—The increase in load for the half-year to September has not been as great as normal, owing to the 10 o'clock closing.

**Darlington.**—The output is practically normal.

**Stockton-on-Tees.**—The quarter ended last September showed an increase of 11 per cent. in lighting and 24 per cent. in power, due to the natural growth of the undertaking, and not due to any war effect.

**Derby.**—There was a temporary drop in power load due to the partial closing down of one very large consumer, but orders from the War Office have rectified this, and both day and evening load curves show an increase of 600 kw. over the corresponding time last year. All trades are busy, especially textile. Twenty-five per cent. of the electricity works employees have joined the Army, and the Borough Electrical Engineer's three sons are also serving.

**Shropshire, Worcestershire, and Staffordshire Electric Power Co.**—A large number of manufacturers have received much work due to the war, but other works, such as cycle manufacturers,

&c., are working with diminished outputs. The output on the station is, however, practically the same as for the corresponding time last year, but the maximum load has dropped. It is estimated that both the load and output would have increased considerably under normal conditions. There are, however, numbers of inquiries for extensions of electric driving, so that the outlook is favourable.

**Wolverhampton.**—In the first part of September the revenue dropped about £125 per week, as compared with last year, but the output is now improving, and for the last week in October was only 10 per cent. less than the similar week of last year. The drop is put down due to the holding up of money, difficulties in obtaining raw material, and the stoppage of export orders.

**Stoke-on-Trent.**—The load has dropped considerably. For the week ended October 24th the output was 171,361 units, as compared with 201,357 in the corresponding week of last year. The maximum load has decreased from 3,232 kw. to 2,803 kw. Many of the local manufacturers are working short time, and the lighting has also diminished.

**Bristol.**—The lighting has gone down. Up to the end of July there had been an increase in consumption of 12.38 per cent., but for August and September there was a diminution of about 2 per cent., as compared with last year. On the other hand, the power consumption had gone up 13 per cent. up to the end of July; for August the increase compared with last year was only 9.7 per cent., but for September 19.08 per cent.

**Cardiff.**—The output shows satisfactory increase in every direction.

**West Bromwich.**—In August the increase in load stopped, but in September normal conditions reasserted themselves, and last month the power output was 20 per cent. greater than last October. Owing to Government orders several large consumers are working day and night.

**Kent Electric Power Co.**—Reductions in street lighting, shop lighting, and closed theatres and music halls have reduced the lighting load, and the power load has also been affected.

**Nottingham.**—Very little difference has occurred as compared with last year, but in some of the local industries, such as lace and fancy leathers, trade is bad.

**Chester.**—Not much affected.

**Tunbridge Wells.**—Unaffected by war, except by the loss of several members of the staff.

**Erith.**—Power load increased, lighting load diminished, load factor improved.

**Beckenham.**—Mainly a residential district. The load has slightly increased due to new consumers in the early part of the year.

**Colchester.**—The lighting order has reduced the load by about 20 per cent.

**East Ham.**—For the period between Oct. 10th and Nov. 7th, the output for light and power has decreased by 32.47 per cent. compared with the same period last year, and the maximum load 39.21 per cent. The district is chiefly a small residential one.

**Glasgow.**—Not seriously affected. The output has increased 12 per cent. for the month as compared with last year, but the previous year the increase for the corresponding month was 20 per cent. The public lighting has not been curtailed, but the public are probably economising.

**Clyde Valley Electrical Power Co.**—The output shows a steady increase over the corresponding period of last year. The consumption by collieries has lessened, but engineering works and shipyards are particularly busy. There has been a saving in generating costs, owing to the collieries being slack and coal cheaper.

## THE ELECTRICAL EQUIPMENT OF A LARGE BATTLESHIP

THE electrical equipment of the Argentine battleship *Moreno*, which is nearing completion in a United States yard, is described in a Paper by Mr. H. A. Hornor, read recently before the American Institute of Electrical Engineers. The vessel is of 27,566 tons displacement, and carries twelve 12-in., twelve 6-in., and sixteen 4-in. guns.

The main generating plant consists of four 375-kw. 230-volt continuous-current Curtis turbo-generators, two placed forward and two aft on the lower platform deck behind armour. There is also a 75-kw. Diesel engine driven set on the gun-deck. The main distribution is two-wire, with rubber-insulated lead-sheathed steel-armoured cables. These are clipped to the ship's structure, and watertight fittings are provided wherever the cables terminate or pass through bulkheads. In the smaller sizes twin cables are used. In some places, as in the gun-turrets, flexible branch leads are used, and in officers' quarters and state rooms special brass-covered wire and three-conductor rubber-insulated wires are used. There are two main distribution boards adjacent to the fore and aft dynamo rooms respectively, as well as various auxiliary boards, so inter-connected that supply is always available. The circuit-breaker relays are interlocked, so that in no case can the different dynamo rooms be placed in parallel. Separate positive bus-bars are used for the

lighting and power circuits, but there are common negative bars. The thirty-eight lighting feeders are divided into three circuits; one for general illumination under cruising conditions, one for white battle purposes, and one for blue battle purposes. In this last circuit the globes are of a deep blue colour, making the light invisible at a short distance. The distribution of the small lighting units has been made with due regard for cross circuits, so that no general spaces of the vessel may be put in darkness by the failure of an individual circuit. Thirty-five and sixty-watt carbon lamps are used, as well as 32-watt tungsten lamps for the ordinary lighting, and for various purposes 250-watt tungsten lamps in special portable reflectors are provided. In all, some 3,000 lamps are employed.

The searchlight installation consists of twelve motor-operated remote-control 43·3-in. projectors, and one portable 13·77-in. signalling projector. These are run from a 2×110-volt three-wire circuit, for which two special balancers are employed, situated near the oil-engine room, with a control and distributing board. The lamp mechanism consists of a small electric motor which moves the carbons through gearing. The field and armature are controlled by a differential relay and two auxiliary relays, which cause it either to stop or rotate to right or left. The first takes place with the current and voltage normal, the second when the amperage is too high and the voltage too low, and the third when the last condition is reversed. Besides the regular field winding, there is an additional winding on the motor field to carry the full lamp current. This produces a strong field when the voltage across the arc falls below normal and furnishes a dynamic braking effect for retarding the movement of the motor armature. For signalling purposes the searchlights are equipped with iris shutters. These are all manually operated except one, in which latter case a venetian blind shutter, remotely controlled, is also provided. A sighting telescope attached to the side of the drum, and a complete lamp telegraph indicating the positions of the searchlight at the controller, are furnished with each searchlight.

The power circuits supply 278 motors for different purposes, ranging from  $\frac{1}{4}$  to 150 h.p., aggregating some 4,000 h.p. and including such varied applications as capstans, windlasses, pumps, ammunition hoists, turret turning and gun training, steering gear, ventilators, workshop tools and miscellaneous machinery; vacuum cleaners, ozonisers, and an "athletic horse." Owing to the diversified nature of these services, comparatively few of these motors are running at once. The power feeders are in some cases lead directly to the motor-starting panels, and in others are taken to special distribution boards. The electrical steering gear is designed as auxiliary to the steam gear, and is controlled through the same tele-motor apparatus on a follow-up system. The rudder can be carried right over in 40 secs., about half the time required by the steam equipment. A 150-h.p. motor is employed, controlled by a master controller with limit switch and a contactor panel in conjunction with the necessary rheostats. In the master controller are two contact cylinders, one for the controller, the other for the limit switch. The controller cylinder works through a connecting rod from the operating shaft of the steering gear. The limit-switch cylinder operates through a sprocket chain from the main steering-gear shaft. The differential gear, the "follow-up" device, is designed to turn the controller cylinder off by motion of the main shaft of the steering gear which turns the limit switch. The latter strengthens the field of the motor when the rudder is displaced more than  $10^\circ$  from the midship position. The mechanical connections are such that the motor will stop when the rudder has reached the angle for which the steering wheel has been turned. The motor field cannot be weakened until all of the accelerating contactors have closed, after which the controller will maintain full field until it has been turned through an angle corresponding to  $3^\circ$  movement of the rudder from starting position, and intermediate field from  $3^\circ$  to  $5^\circ$ , after which the motor will run at weak field until the rudder has reached  $10^\circ$  from the midship position. The limit switch is arranged to stop the motor at the  $35^\circ$  position of the rudder. Dynamic braking is provided in connection with the electro-mechanical disc brake, in order to provide prompt stopping.

The turret-turning and gun-elevating gear are operated by constant-speed motors, and speed variations are accomplished by mechanical means. The main ammunition hoists are operated by hydraulic power, and the electric hoists are provided as an auxiliary. Two upper hoists are fitted in each of the six turrets. The apparatus consists of a contactor panel, the master controller at the bottom of the hoist, the emergency controller at the top of the hoist,

the limit switch and rheostats. When the hoist, therefore, reaches its limit in either direction dynamic braking is introduced and the motor stops. The top and bottom controllers are elaborately interlocked. The electrical anchor windlass equipment forms an auxiliary to the steam windlass, and only runs at half its speed. A 100-h.p. compound-wound motor is used, controlled through contactors by two master controllers, one in the windlass room and the other on the weather deck. The control is semi-automatic; the first three steps are controlled by the master controller, after which the automatic acceleration contactors come into action. There are, of course, other applications of electric power too numerous to particularise. The ship carries a complete Röntgen-ray outfit, and even an electrically-worked cinematograph apparatus.

Another important part of the electrical equipment is the signalling system for transmitting orders throughout the vessel, fire alarms, electric clocks, speed, steering, and other indicators, gun control, &c. These systems are supplied with power from two stations on the vessel, the forward interior communication room and the forward dynamo room. There are two central signalling stations, one forward on the upper platform deck below armour, and the other on the gun deck aft. A number of these equipments work on 220 volts direct current, supplied in duplicate from the forward and after main distribution switchboards. However, certain of the telegraph systems require 120 volts alternating current; others, such as telephone system, clock system, call-bell system, require 15 volts direct current; and the fire-control telephone system requires 35 volts direct current. These transformations are accomplished by means of small motor-generators. The engine room and other order telegraphs are of German origin, working with alternating current and acting on the principle of an unbalanced circuit. The armature of the transmitter is wound with three inter-connected coils and connected by three wires directly to the armature coils of the receiver. The power in the armature windings depends upon the rotative position of the armature coils in the field of force. If the armature of the transmitter and receiver have the same position relatively to the field, then the induced E.M.F. would be of the same value, and the wires between the two armatures would carry no current. If the armature of the transmitter is moved so as to unbalance the armature circuit, then current flows in the armature windings, produces a torque, and the armature of the receiver turns to the same position. When this occurs the equalising currents disappear, and with them the torque.

Electrical pyrometers are used in the boiler rooms, and an unusual part of the equipment is an electrically-recording anemometer of French origin. The Molinari (Italian) speed indicator is used for the turbine revolution and direction indicators. The wireless telegraph equipment is German, acting on the quenched-spark system, taking 8 kw. and giving wave-lengths from 600 to 2,000 metres. The guaranteed range is 621·3 miles by day and 1,304 miles by night. The ship is provided with an equipment of gyrostatic compasses of the German Anschütz pattern, driven from special motor-generators.

**Home Office Prosecution.**—In connection with the explosion at Clifton Colliery, Workington, Cumberland, on Aug. 3rd, some of the officials of the colliery have been summoned for various contraventions of the rules, including causing the Lick-bank seam earth conductors to carry cables carrying electricity to have a cross-sectional area of less than 0·022 sq. in., and with causing cables carrying medium pressure alternating electro current to be unprotected. The case came before the Workington Police Court on Oct. 21st, but was adjourned till Oct. 28th, when the defendants pleaded guilty and no technical evidence was taken. The Bench found that a technical offence had been committed, and said that the payment of costs would meet the case.

**University College, London.**—The calendar of the present session has now been issued, and contains full information regarding the organisation of working of the College. Prospectuses of the courses and examinations in all the faculties are given, with sample examination papers. The electrical engineering department of the Faculty of Engineering, which is under Prof. J. A. Fleming, F.R.S., is fully dealt with, and particulars are given of a number of scholarships and special prizes available to students of these subjects. The ordinary course occupies three years, but arrangements are made for special shorter courses to those partially trained elsewhere, and there are opportunities for research and other post-graduate work.

**Ediswan Works.**—A visit to the Edison & Swan United Electric Light Co., Ltd., was paid by the Polytechnic Engineering Society last week, when the various lamp and fittings departments were seen in active operation.

## LUNDBERGS' ELECTRIC-LIGHT SWITCHING COMPETITION

IN accordance with the announcement made in our last issue, we now give further details of Messrs. Lundbergs' Electric-Light Switching Competition:—

Prizes are offered for the best answers to a series of three question papers (Preliminary, Intermediate, and Advanced), which will be published in the next three issues of *ELECTRICAL ENGINEERING* in the above order. The questions are based on the new and enlarged third edition of "Lektrik Lighting Connections," which will be required by competitors.\* The booklet deals thoroughly with the art of switch control in electric-light installations, and no less than 25,000 copies of it have been printed up to date. Most of the questions set will not be directly answerable from the booklet, but will be real tests that the competitor can see between and beyond the circuits described and illustrated therein.

There is no fee for the examination, and it is only necessary to work out at home, with the help of the booklet, the answers to ONE of the three Examination Papers which will be printed in the next three issues of *ELECTRICAL ENGINEERING*, and to send them on to the Editor.

The answer papers need not reach the offices of *ELECTRICAL ENGINEERING* until Jan. 11th next, so that there will be ample time for those to whom the subject is more or less novel. Papers from competitors residing in the distant colonies may reach these offices any time up to June 1st next; but they will be eligible for certificates only, not the prizes. Any overseas competitors who can get their answers in by Jan. 11th will, of course, be in the running for prizes as well.

The Examination Papers will be Preliminary, Intermediate and Advanced, and the ground covered will be as follows:—The Preliminary will deal mainly with pp. 41 to 66 of the booklet (new third edition).\* The Intermediate will touch on the easier circuits throughout the booklet. The Advanced will deal with the whole of the booklet.

### CERTIFICATES.

Messrs. Lundbergs' Preliminary, Intermediate, or Advanced Electric-Light Switching Certificates will be awarded to all competitors whose papers show a proper degree of excellence; but those *Intermediate or Advanced papers which fall below the standard, though otherwise satisfactory, will be awarded lower-grade certificates.*

### MONEY PRIZES.

*Advanced Grade.*—1st Prize, £5; 2nd Prize, £2 10s.

*Intermediate Grade.*—1st Prize, £3; 2nd Prize, £1 10s.

*Preliminary Grade.*—1st Prize, £1 10s.; 2nd Prize, 15s.

N.B.—In the event of an exceptionally large number of papers being received, an extra prize (or prizes) may be awarded. Further, should any paper show exceptional merit and yet fail to secure one of the above-stated prizes, a special prize may be given in respect thereof.

### BOOK PRIZES.

The six competitors who follow the prize-winners in the Advanced Section will be presented with copies of Mr. Perren Maycock's book, "Electric Circuit Theory and Calculations." The six who follow the prize-winners in the Intermediate and Preliminary Sections will be presented with copies of the book, "Small Switches, etc., and Their Circuits."

The papers will be examined by Mr. W. Perren

\* For the convenience of our readers we have arranged to keep a stock of this Booklet, and a copy will be sent by return of post on receipt of seven penny stamps. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 23, Temple Chambers, London, E.C.

Maycock, M.I.E.E., and the names (or *noms-de-plume*) of the successful competitors will be announced in *ELECTRICAL ENGINEERING* of Feb. 25th next.

The practical use of the above tests is proved by the fact that as the result of the last two examinations, 147 competitors passed in the Preliminary Grade, 73 in the Intermediate Grade, and 43 in the Advanced Grade. The names were announced in *ELECTRICAL ENGINEERING* of Nov. 6th, 1913, and April 30th last.

## FUTURE OF LONDON'S ELECTRICITY SUPPLY Scheme Passed by L.C.C.

THE scheme of the London County Council for dealing with the supply of electricity in the large area outlined in the Special Committee's report (*ELECTRICAL ENGINEERING*, July 30th, p. 428, and Nov. 5th, p. 577), was passed at the meeting on Tuesday by 77 votes to 7. This decision was arrived at after the defeat of an amendment by Sir John Benn that the scheme should be entirely municipal, and another amendment by Mr. H. H. Gordon (Stepney) that any municipality in the proposed area could by resolution contract out of the scheme, and not incur any financial responsibility under it. In the final voting a considerable number of Progressives voted for the scheme; the general feeling was that it is urgent, and the only difference of opinion was as to the desirability of co-operation with the proposed new Company. Sir John Benn's amendment on this point was defeated by 63 votes to 44, but only 8 members voted for Mr. Gordon's proposition. The proceedings were watched by a number of those intimately concerned in the scheme, including Mr. C. H. Merz, whose report to the Council was given in *ELECTRICAL ENGINEERING*, April 16th, p. 213; Mr. H. Renwick (County of London Electric Supply Co.); Mr. James Devonshire (North Metropolitan Electric Power Co.); Mr. W. C. P. Tapper (Chief Electrical Engineer, Stepney); and Mr. J. W. Beauchamp (Chief Electrical Engineer, West Ham).

The discussion followed on party lines, the Moderates contending that considerable concessions had been made to the other side in order to arrive at a compromise. Each party acknowledged the good work of the other on the Special Committee, which has drawn up the scheme. Mr. H. H. Gordon, however, who has been associated with the Stepney electricity undertaking, attempted to show, in a long speech, that the scheme was bad both technically and financially, and alleged that Messrs. Merz & McLellan's report (*ELECTRICAL ENGINEERING*, April 16th, p. 213) was founded on false promises. The general feeling that London was handicapped by dear electricity was not, he maintained, borne out by the facts; indeed, electricity was cheaper in London than in any of the big cities in the world, except, perhaps, Chicago, which had an exceptionally large traction load. The average prices he quoted were New York, 2.6d. per unit; Boston, 2.7d.; London, 2.3d. He agreed that there were too many producers of electricity in London, but there were two schools of thought to be considered in tackling the problem. The first one he termed the evolutionists', in which could be numbered Sir John Snell, Sir Alexander Kennedy, and all the engineers who had been practically engaged in this and similar problems. The opinion of this school was that London could not be treated as virgin ground, and we could not afford to scrap the plant already installed. The only way was to proceed gradually, make the utmost of the plant now in use, and evolve the big scheme in that way. The other school of thought he termed the megalomaniacs', whose idea, based on foreign thought and culture, was to scrap everything at the earliest possible moment in order to embark upon the large scheme with large power stations. He belonged to the evolutionists. He complained that the Committee gave no figures as to the possible financial results, and the only figures before them were in the experts' report. In this it was stated that if the 1911-12 average costs remained stationary until 1920, the big scheme would show a decrease of 34 per cent. in working expenses. But already three London boroughs, in the two years since 1911-12, had improved upon their figures from that year by 20 per cent., and it seemed extremely unlikely there would be any saving in the big scheme at all. Again, the whole proposition was on the basis of capital being borrowed at 4 per cent., but who was sanguine enough to suppose that, after the war was over, money would be obtained on such terms? He maintained that many of the existing supply authorities would be able to produce as cheaply as the proposed new authority, and so could not be customers of that body, yet they would have, under the scheme, to ask the permission of their trade rival before they could extend their works. The best way was to seek the co-operation of the existing authorities and work the thing out gradually. By far the greatest pro-

portion of the cost of electricity supply was capital charges, and to increase the capital expenditure, having regard to the plant already installed, could not seriously reduce the charge to the consumer.

Sir John Benn, Mr. Harris, and Mr. Gilbert, on the Progressive side, took the view that in bringing in the proposed new company the Council was riding for a fall when the Bill came before Parliament, as Committees of Parliament which had previously dealt with the matter had always expressed the opinion that the Bill should be the authority.

On the other side Mr. Hume, Chairman of the Special Committee, Mr. Cyril Jackson, and Mr. Reynolds said that any scheme produced on purely party lines was doomed to failure in the Council itself. Already a group had expressed themselves willing to form the new company, and the right thing to do was to let a Parliamentary Committee go into the proposal. Schemes with similar control were working satisfactorily in several cities in other parts of the world, and none of the previous schemes to deal with London had had less compulsion in them than the present one. At the same time, it was hinted that if the opposition in Parliament was so strong as to imperil the Bill this session, then, in order to avoid controversy at the present time, Parliament would be asked to postpone the Bill until the following session.

**Engineering in Scotland.**—Mr. Blyth's Presidential address to the Institution of Civil Engineers last week dealt with the progress of all branches of engineering in Scotland. With reference to electrical developments, he said that so far nothing had been done in Scotland with regard to the electrification of the railways, but, he continued, "I think there can be no doubt it would be a great improvement and a considerable saving in cost if many of the suburban tunnel lines in and around Glasgow were equipped for electric traction." In speaking of the electrical utilisation of water power, he referred to the first works of the British Aluminium Co. at the Falls of Foyers, and to the scheme in conjunction with the Highland Water-Power Co. for taking the waters of Loch Erich and some smaller lochs in Perthshire right across Argyllshire for use at a manufacturing station at the head of Loch Leven. This scheme was, however, rejected, but a modified scheme was carried through without encroaching on Loch Erich with a dam at the west end of Blackwater Lochs and pipe to the head of Loch Leven. These works are now in full operation, and several large companies are now working in Scotland producing electricity for power and lighting purposes. Tramways, he said, were to be found in all the principal cities, and in many country districts, and these, with the single exception of Edinburgh, are worked on the overhead electric system.

**Trading with the Enemy.**—The Committee of the Employers' Parliamentary Association have passed resolutions recording their opinion that the restrictions laid down by the Trading with the Enemy Proclamation No. 2 and the Trading with the Enemy Act are inadequate. They consider that the expression "enemy" should be extended to embrace any German or Austrian person or group resident in any country, and any company whose management or interests are wholly or preponderantly under German or Austrian influence, or where capital to the extent of one-third is held by Germans or Austrians. The status of such companies to be determined by their status on June 1st last. They also urge that provision be made for a licence to trade being granted on application to suitable enemy firms, provided that their businesses be placed in the hands of a Receiver, except in the case of small self-contained businesses not forming branches of a concern in an enemy country, but that in no case should such a licence be granted to an enemy in this country merely agenting the products of enemy countries.

**British Trade with the Straits Settlements.**—Mr. A. Stuart, Registrar of Imports and Exports at Singapore, the Correspondent of the Board of Trade for the Straits Settlements, who is now on a visit to England, will attend at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., on Tuesday, Wednesday, and Thursday, Nov. 17th, 18th, and 19th, between the hours of 10 a.m. and 5 p.m., and will be pleased to see by appointment British manufacturers and traders not represented in the Straits Settlements who may desire to consult him regarding trade conditions and openings in that Colony. Applications for appointments with Mr. Stuart should be made promptly to the Director of the Commercial Intelligence Branch, as above.

**Storage Battery Working.**—At the Junior Institution of Engineers, Mr. R. Rankin lectured recently on "The Working of Storage Batteries." Particular stress was laid on the necessity of giving a battery a good send off by a proper first charge, and the necessity of continuing it until there was a complete cessation of increase in specific gravities and voltages was insisted on. One fruitful source of trouble was excessive discharging, and Mr. Rankin described an instrument which he had invented to enable battery operators to keep within proper limits. Attention was drawn to the necessity of keeping proper log sheets. It could not be expected to keep their cells in decent condition unless hydrometers and cell-testing voltmeters and means for giving individual cells a boosting charge in excess of that given to the main body of the battery were provided.

## THE POINT FIVES

At a meeting of the "Point Fives" at Manchester, on October 16th, Mr. F. Ayton (Ipswich) was elected a member. Mr. W. G. Pickvance (Wrexham) was in the Chair, and delivered an address on the aims and objects of the Association, the principle of which was to encourage the development of electric supply for domestic purposes other than lighting at not more than one halfpenny per unit. The question of the power load was, he thought, outside their scope. He particularly favoured the hiring out of cookers and heaters and the securing of the co-operation of manufacturers in this way. In cases where powers of this work were unobtainable, he even suggested that the engineer should be allowed to carry on a wiring fittings business on his own account. The domestic load was going to be of great importance to the small supply engineer, who was threatened by a reduction of his lighting revenue and had no power-load to fall back upon, but he must not lose sight of the fact that large extensions of mains must be provided for in framing a tariff, as well as a certain amount of extension of generating plant. The matter was not so easy as the building up of a power-load, as the cooker was not in as advanced a stage as the electric motor; although it was fast improving in reliability, its cost was still a great handicap in competition with the gas cooker.

In the discussion Mr. G. T. Allen (Wolverhampton) explored the effect of municipal gas departments preventing electricity departments using the full powers they possessed for hiring out electric cooking appliances. Mr. F. V. W. Purse (Carlisle) spoke of the handicap to authorities who had not those powers, and Mr. A. H. Shaw (Ilford) referred to difficulties of a similar nature. The reliability of modern forms of electric cooker was vouched for by Mr. W. H. Cooke (Luton), Mr. H. A. Nevill (Wakefield), Mr. Hame (York), Mr. A. H. Seabrook (Marylebone), and Mr. T. Roles (Bradford) spoke favourably of an electric heater manufactured by the British Electric Heater Co., and said that we were just on the point of solving the domestic hot water problem. Mr. J. H. Bowden (Poplar) described the policy that he was adopting with artisans' dwellings. These were fitted with six lights and a hot plate, which latter would do nearly all the cooking required in that particular class of residence. The wiring was included in the price charged, and the prepayment system by slot meter was adopted. The total charge to the consumer (including wiring, supply of hot plate and current) was from 1s. 6d. to 2s. per week. This was probably the first time that electric cooking had been attempted in property of this class. Many of the speakers agreed that there would be no serious trouble with the mains question.

The Chairman in his reply said that the problems facing the small station engineer were greater than those that had to be dealt with by engineers having larger undertakings to control. Until their association could adopt measures to attract those undertakings whose circumstances were more favourable, there would be little chance of inducing small undertakings to adopt this tariff. He felt that, once thoroughly established on a commercial basis, the sale of cookers at a reasonable rate would give the opportunity to the small undertakings for which they were waiting. He believed that people in houses of rentals varying from £25 to £50 would be the most likely to adopt electric cooking.

**Arrangements for the Week.**—To-day (Thursday), November 12th. Institution of Electrical Engineers. "Cables," by C. J. Beaver. 8 p.m.—Greenock Electrical Society, 21 West Stewart Street. "Rotary Converters," by P. C. Kerr. 7.45 p.m.

Friday, Nov. 13th. Physical Society, Imperial College of Science, London. "A Bridge for the Measurement of Self-Induction," by D. Owen. 8 p.m.—Wireless Society of London, at Institution of Electrical Engineers. "The Function of the Earth in Radio-Telegraphy," by Dr. J. A. Fleming, F.R.S. 8 p.m.

Saturday, Nov. 14th. Birmingham and District Electric Club, Swan Hotel, New Street. "Gas Turbines," by W. Fennell. 7 p.m.

Monday, Nov. 16th. Electro-Harmonic Society, Holborn Restaurant. Concert (Ladies' Night). 8 p.m.

Tuesday, Nov. 17th. Institution of Electrical Engineers, Manchester Section, at Engineers' Club, Albert Square. "Cables," by C. J. Beaver. 7.30 p.m.—Institution of Civil Engineers. "Economics of Electric Railway Distribution," by H. F. Parshall. 8 p.m.

Wednesday, Nov. 18th. Institution of Electrical Engineers, Birmingham Section, at University. Chairman's Address, by Dr. A. H. Railing. 7.30 p.m.

Thursday, Nov. 19th. Institution of Electrical Engineers, Dublin Section, at Royal College of Science. Chairman's Address, by Mr. G. Archer. 8 p.m.

Friday, Nov. 20th. Institution of Mechanical Engineers. "The Effect of Vacuum on Steam-Turbines," by G. G. Stoney, F.R.S.

## BOOKS

*We shall be pleased to send any of the following books to addresses in the United Kingdom at the prices named.*

*Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.*

- Electric Wiring. W. C. Clinton. 3rd ed. 2s. net; by post, 2s. 3d.
- Electric Light Fitting. S. C. Batstone. 5s. net; by post, 5s. 4d.
- Electric Circuit. Theory and Calculations. W. P. Maycock. 3s. 6d. net; by post, 3s. 10d.
- Electric Wiring, Fittings, Switches, and Lamps: Circuits. W. P. Maycock. 6s. net; by post, 6s. 4d.
- Electrical Tables and Memoranda. S. P. Thompson. 2nd ed. 1s. net; by post, 1s. 1d.
- Electricity in Factories and Workshops. A. P. Haslam. 7s. 6d. net; by post, 7s. 10d.
- Ship Wiring and Fitting. T. M. Johnson. 1s. net; by post, 1s. 1½d.
- Mill and Factory Wiring. R. G. Devey. 2s. net; by post, 2s. 2d.
- Electrical Mining Installations. P. W. Freudemacher. 2s. net; by post, 2s. 2d.
- Lektrik Lighting Connections. 3rd ed. 6d. net; by post, 7d.
- Bells, Indicators, Telephones, and Burglar Alarms, &c. Redfern and Savin. 1s. 6d. net; by post, 1s. 7½d.
- The Uses of Electricity. Part I. Electric Lighting. 1d.; by post, 2d. Part II. Electric Cooking and Heating. 2d.; by post, 3d. Part III. Works Driving. 2d.; by post, 3d.
- Simple Electric Cookery. May Little. 1s. 6d. net; by post, 1s. 9d.
- Electric Cooking, Heating, Cleaning, &c. A Manual of Electricity in the Service of the Home. By "Housewife." 3s. 6d. net; by post, 3s. 10d.
- Arc Lamps and Accessory Apparatus. J. H. Johnson. 1s. 6d. net; by post, 1s. 7½d.
- Institution of Electrical Engineers' Wiring Rules, with Extracts from the Board of Trade Regulations and the Home Office Rules for Mines. 6th ed. 6d. net; by post, 7d.
- Village Electrical Installations. W. T. Wardale. 2s. net; by post, 2s. 2d.
- Dynamo and Motor Attendants and their Machines. F. Broadbent. 7th ed. 1s. 6d. net; by post, 1s. 9d.
- Continuous Current Dynamos and Motors and Their Control. W. R. Kelsey. 2nd ed. 7s. 6d. net; by post, 7s. 10d.
- The Induction Motor. B. F. Bailey. 10s. 6d. net.
- Foundations and Machinery Fixing. F. H. Davies. 2s. net; by post, 2s. 2d.

*Larger or more advanced books on many of the above subjects, and also on other branches, will be recommended on application.*

**German Electrical Trade with Canada.**—The (Canadian) *Electrical News* publishes the following approximate values of German electrical exports to Canada during 1912: Dynamos, motors, transformers, &c., £1,350; cables, £500; arc lamps, £550; metal filament lamps, £27,350; carbon lamps, £5,400; signalling and protective apparatus, £11,650; apparatus for lighting, transmission of power, &c., £3,200; electro-mechanical apparatus, £300; measuring instruments, £3,650; batteries, &c., £650; heating and cooking apparatus, £100; insulating tubes, £250; total, £54,950. The corresponding totals for 1911 and 1910 are £30,200 and £14,750.

## FATAL SHOCK FROM NEUTRAL BAR

A CURIOUS death from electric shock at the Greenwich power house of the London County Council was investigated at the Greenwich Coroner's Court on Monday. David Macredey, an engineer at the power station, had his attention called to a leaky gland on a transformer oil-pump. Going to look at it, he at the same time inspected the oil-gauge, to do which he climbed the channel irons fixed around the transformer, the projections of which form steps. He stood upon one of these irons with his back to the concrete wall. Close to his head was the neutral bar of one of the generators, which was uninsulated, and by some means his head came into contact with this, as was shown by the presence of blood and hair upon it. Normally, of course, there should not be a very high pressure at this point, and under the Home Office regulations any point must be protected where the pressure exceeds 125 volts. A test after the accident, however, showed that the pressure was between 450 and 500 volts. The bar in question was not directly earthed. To present an interchange of current between machines in parallel through the neutral points of the star windings due to the "third harmonic" effect, only one machine is earthed (through a resistance), and it is, of course, assumed that the neutral points of the others also assume zero potential. A small difference might be expected owing to slight inequalities in the windings, but so large a voltage as this—about 0·8 per cent. of the pressure of 6,000 volts between phases—was not anticipated. Unfortunately, deceased, who was fifty-four years of age, suffered from a badly diseased heart, and as his feet must have been making a good earth, a 450-volt shock right through his body was sufficient to kill him. The necessary protection to these bars has now been fitted. The jury returned a verdict of accidental death. Mr. G. S. Ram, Chief Electrical Inspector to the Home Office, was present, and called attention to the need for applying artificial respiration for a prolonged period. He referred to a case where a healthy man in South Wales received a 2,000-volt shock, and the doctor certified him dead. After the departure of the doctor, however, his comrades recommenced artificial respiration, and succeeded in saving the man's life. There was always, he said, a chance for two hours. In the present case efforts were made to restore life for more than an hour, and there is no suggestion that a longer period would have been of advantage, especially as the man had a weak heart, as already stated.

## ELECTRICAL ENGINEERS AND THE WAR

THE subject chosen by Mr. T. Roles for his Chairman's Address to the Yorkshire Local Section of the Institution of Electrical Engineers was the relation of the war to the British electrical industry. The first question to all those of suitable age and health was whether they should take up arms, but the consideration should not be lost sight of as to whether one could assist in securing our country's victory better by bearing arms or remaining at home and carrying out work which, though more prosaic, was none the less necessary. After urging that all who possibly can should answer their country's call, Mr. Roles considered the immediate duties devolving on those who decided to remain in civil life, and summarised them as follows:—To execute with energy all work on which they may be engaged which is in any way connected with military requirements. To assist by all means in their power persons who are anxious to join the military forces in the attainment of their desire, and to encourage those who are capable of bearing arms, and are in a position to do so, to enlist. To assist in and to encourage all efforts made to contribute to the comfort of our troops on active service and the welfare of their dependants at home. To do all possible to support the sentiment "Business as Usual" with regard to the electrical industry in particular and all other British industries in general. To assist in every way possible the efforts which are being made by British manufacturers to capture and retain foreign and colonial trade which until recently has been in the hands of alien enemies. To consider carefully the methods of educating and training young electrical engineers with a view to reorganising and improving such methods, in order that in future the designing as well as the manufacture of all electrical apparatus required for the naval and military services shall be carried out by British-born subjects. Special attention should also be given to business training, so that the business methods of British firms may be entirely up-to-date, and their sales organisation controlled by Britishers.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Nov. 5th, 1914

A full list of those of electrical interest among these was published in our last issue. The following are abstracts of some of the more important specifications

Names in italics indicate communicators of inventions from abroad.

15,729/13. **Frequency Raising.** A. M. TAYLOR. In a system of frequency raising by static transformers, as described in Spec. 8,853/11 (see ELECTRICAL ENGINEERING, Vol. VIII., p. 448, Aug. 8th, 1912; and April 30th, p. 238), as applied to wireless telegraphy, a method of reducing the period covered by the E.M.F. of the secondary or working transformer by the application to the primary of an E.M.F. wave having a peak of shorter duration than the natural period of the source of supply. (Four figures.)

19,603/13. **Insulating Rail Joints.** B. R. WILLS and J. C. SYKES. The fish-plates and other necessary parts are insulated by vitreous enamel coatings on layers of prepared metal.

23,281/13. **Air Filters.** HEENAN & FROUDE and W. WHEAL. Filters for cooling and purifying air supplied for ventilation of generators, in which a number of convolutions of sheet metal, cloth, or other material are wound about a central shaft and partly immersed in water in an enclosed casing, through the upper part of which and through the convolutions of the drum the air is drawn in an axial direction. (Two figures.)

23,557/13. **High-frequency Alternator.** MARCONI'S WIRELESS TELEGRAPH Co. and C. S. FRANKLIN. In this machine, the stator has a number of poles separated from each other and arranged in lines, and the rotor has long poles making a small angle with the stator pole lines, so that each rotor pole passes in succession across the row of stator poles. (Four figures.)

25,598/13. **Protective System.** B.T.-H. Co. and E. B. WEDMORE. An A.C. protective system in which the inductive effects of the current in the several phases and the neutral are added for the purpose of disconnecting the source of supply on the occurrence of an internal fault only. (Six figures.)

25,695/13. **Choking Coils.** K. M. FAYE-HANSEN. Choking coils having completely closed external magnetic shells with laminæ parallel to the axis of the coil and built up to a height greater than the width of the opening of the coil, the opening thus formed constituting an air-gap, which may be filled in with non-magnetic material.

16,319/14. **Traction Control.** A. J. HALL and L. G. RILEY. A system of control of single-phase locomotives by contactors with automatic acceleration and other features. (Two figures.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** CLOTHIER and A. REYROLLE & Co. [Protective systems] 27,660/13; CALLENDERS CABLE & CONSTRUCTION Co. and KAY [Cable supports] 1,143/14; CREIGHTON [Protective devices] 5,542/13.

**Ignition:** PLUMSTEAD [Ignition of gas burner] 28,499/13; SPADA [Spark plug] 2,499/14.

**Switchgear, Fuses and Fittings:** YATES [Fuses] 12,953/14.

**Telephony and Telegraphy:** QUITO [Synchronisation by electric waves] 20,798/13, and [Remote control of torpedoes] 21,212/13; FOOTE [Telephone transmitting apparatus] 22,157/13; WESTERN ELECTRIC Co. (Woodward, acting for W.E. Co.) [Exchange systems] 23,565/13; HANCOCK [Telegraph insulators] 24,755/13; CONNER [Telephone switching] 27,905/13; ARNOLD [Telephone relays] 9,092/13.

**Traction:** W. R. SYKES INTERLOCKING SIGNAL Co. and TARRANT [Signal relays] 25,332/13.

**Miscellaneous:** COATES and A. REYROLLE & Co. [High-tension terminals] 23,342/13; BAKER [Electrical treatment of animals] 28,415/13; JOYCE and SPAGNOLETTI, LTD. [Ignition of miners lamps] 15,324/14; FAIRHOLME and CLARKE [Apparatus for electrocuting animals] 17,603/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Incandescent Lamps:** PROGRESS MOTOREN UND APPARATENBAU GES., 27,657/13.

**Telegraphy and Telephony:** DIXON [Printing telegraph receivers] 10,716/14; SCHIESSLER [Wireless telegraphy and telephony] 11,708 and 11,709/14.

**Miscellaneous:** DEAN [Electric horns] 5,347/14; ESC. ANON. DES ETABLISSEMENTS L. BLERHOT [Car lighting] 20,505/14; KRAGH and MEYER [Telegraphophone] 21,185/14.

### Amendments Allowed

18,661/14. **Electric Mine Signalling.** STERLING TELEPHONE and ELECTRIC Co., LTD., and J. W. DUNGEY. Leave has been given to add the name of F. G. Bell as an inventor in this application.

26,660/12. **Vacuum Cleaner Control.** R. F. CAREY and R. WAYGOOD & Co., LTD. This specification has been amended by way of disclaimer. It describes a method of remote control of the exhausting pump by the operator at the hose. The switch is actuated by a fluid pressure relay worked through a pipe alongside the hose controlled by a valve at the nozzle. The system is applicable in a modified form to hydraulically driven vacuum pumps.

29,359/12. **Party Line Telephones.** AUTOMATIC TELEPHONE MANUFACTURING Co. This specification has been amended by way of disclaimer. It describes an improved party line telephone system in which automatic switches are employed for establishing contact between a calling and a called subscriber's line, and in which the ringing current is applied automatically to a called party line in order to signal selectively the different stations of the party line.

### Opposition to Grant of Patents

Opposition has been entered to a grant on the following application:—

19,443/13. **Motor Control.** B.T.-H. Co. and R. D. GIVEN. This is for a system of controlling three-phase winding motors by liquid rheostats with variable liquid level, in conjunction with a pneumatically actuated reversing switch. A separate rheostat is used for each direction of rotation of the motor.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

20,507/00. **Spark plug.** R. F. HALL. Sparking plugs with a later insulating body fitting tight into the case of the plug. Double pole and double contact plugs are described, as well as the ordinary kind. (This is the plug known as the E.I.C. plug.)

20,576/00. **Wireless Telegraphy.** J. A. FLEMING and MARCONI'S WIRELESS TELEGRAPH Co. Controlling the emission of waves by the action of a jet of compressed air on the spark discharge.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BRITISH INSULATED & HELSBY CABLES, LTD., and F. A. COLE [Cable armouring] 15,641/08.

**Electrochemistry and Electrometallurgy:** S. E. PAGE (*Universal Electric Welding Co., U.S.A.*) [Welding of angle and T-pieces] 15,424/08; B. E. D. KILBURN (*E. Oesterle, U.S.A.*) [Electric furnace] 15,645/08.

**Incandescent Lamps:** SOC. FRANÇAISE D'INCANDESCENCE PAR LE GAZ (SYSTÈME AUER) [Metal filament lamps] 15,913/09.

**Switchgear, Fuses and Fittings:** F. T. REID [Time switches] 16,646/06.

**Telephony and Telegraphy:** A. T. M. JOHNSON and JOHNSON'S SECRET WIRELESS TELEGRAPH & TELEPHONE TESTING SYNDICATE [Wireless syntonic relays] 16,746/06.

**Traction:** JOHNSON-LUNDELL ELECTRIC TRACTION Co. [Regenerative control] 15,275/08; M. E. CURWEN (*Brill Co., U.S.A.*) [Tramcar trucks] 15,750 and 1/08.

**Miscellaneous:** H. SEFTON JONES [Electric vehicles driving and steering by same wheels with control interlocked with steering gear to give differential action] 16,489/02; E. C. R. MARKS (*Soc. Anon. Italiana e Ansaldo, Armstrong & Co., Genoa*) [Gun training] 15,660/08.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,416.

Discuss the advisability of running "inverted" rotaries in parallel on both D.C. and A.C. bus-bars, (1) in parallel with each other; (2) in parallel with each other and a separate A.C. supply. The rotaries in question are shunt wound, and are fitted with direct-coupled exciters, and each feeds into the A.C. bus-bars through a separate transformer.—"M. S."

(Replies must be received not later than first post Thursday, Nov. 19th.)

### ANSWERS TO No. 1,414.

No reply worthy of an award has been received.

## ELECTRIC TRACTION NOTES

The London County Council proposes to apply to Parliament next session for various new tramways and linking-up of dead-ends, at an estimated cost of £787,035 for construction and £94,850 for street widenings.

Although the Bristol Corporation has received Parliamentary powers to purchase the Bristol Tramways and Carriage Co., there is still considerable opposition to the idea, and on behalf of the owners and occupiers who petitioned against the Corporation Bill in Parliament last session, Mr. A. Dickinson has prepared a report, giving his views as to the financial aspect of the purchase. Mr. Dickinson estimates that the Corporation may be called upon to pay about £1,215,000 as the purchase price of the undertaking.

The draft agreement between the Stoke-on-Trent Corporation and the Potteries Electric Traction Co. proposes that the Corporation shall not exercise any of its purchase powers before the year 1940, in consideration for which the Company will pay the Corporation £2,000 per annum for the next thirteen years and £3,000 per annum after that until 1940. The Company also undertakes to double certain lines and carry out a number of other improvements as regards rolling-stock, &c.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Egyptian Authorities notify the interruption of the El Arich route.—On the 4th inst. the Zante cable was so busy as to involve delay of twenty-four hours and over to telegrams. The Chio-Tchesne cable had also ceased working.—Lines between Dombé Grande and Quilengues were down on the 6th inst. Messages are being sent *via* Mossamèdes.—Telegraphic service with the interior of Hayti has been

suspended.—Cable communication with Syra is interrupted between Constantinople and Tenedos. The *via* Fao route is also down.—Messages for Tauris, Khoi, Salmas, and Ourmia cannot be accepted, owing to failure of lines.—The British India Administrations will stop all telegrams in transmission for Turkey.—The Obock-Djibouti cable is broken, and messages are being sent *via* Obock.—The route to the Dutch East Indies *via* Guam and Yap is suspended.—The Pacific Cable Board has now restored the Fanning Island cable, interrupted by the German cruiser *Nürnberg*.

A German named Harold Fochtenberger, aged 20, who was, it is reported, working at Siemens Bros. & Co.'s works under an assumed name, was found to possess a complete wireless telegraph apparatus at his home at Thorpe Bay, near Southend-on-Sea, and has been handed over to the military authorities to be dealt with.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**TRAMCAR LIGHTING.**—A convenient combined switch and fuse for tramcar lighting circuits is described in a pamphlet from the British Thomson-Houston Co., Ltd. (Rugby). The base and cover are of glazed porcelain in the 600-volt design, and of a special moulded insulating material in that for higher voltages, and a cartridge fuse mounted in clips so as to be easily replaceable is employed.

**ELECTRIC COOKING.**—The Brompton and Kensington Accessories Co., Ltd. (254-260 Earl's Court Road, S.W.) have issued a series of leaflets forming a complete catalogue of electrical cooking appliances, including complete cooking stoves and ranges in several designs, both for domestic and restaurant cooking, hot cupboards and carving tables, grills and toasters, as well as many attractive forms of table apparatus, such as water heaters, kettles, breakfast grills, coffee percolators, tea-pots, hot plates, and flat irons.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

**ELECTRIC CLOCKS.**—A descriptive catalogue of electric clocks has just been published by the Magneta Time Co., Ltd. (14 Soho Square, W.C.). In this system, which is in extensive use, there are neither batteries nor intermittent contacts, as the current impulses are produced magnetically. A large number of forms of master clock and dial are illustrated, and many buildings are mentioned where they are in use. We are informed that all the apparatus concerned is of British manufacture, being made at the company's Watford Works.

**POSTER.**—Rawlings Bros., Ltd. (82 Gloucester Road, South Kensington), have sent us a postcard on which is reproduced an attractive poster, designed by Mr. Kelly, a member of their staff. It is entitled "In a Warm Corner," and shows a very satisfied recruit warming himself at a radiator, which is humorously said to be supplied with current by the field battery. The same artist produces a poster, which is exhibited at Gloucester Road and South Kensington stations every month.

**DYNAMOS AND MOTORS.**—A comprehensive list of electrical plant is to hand from the Anglo-Colonial Engineering Co., Ltd. (13 City Road, E.C.), containing full particulars of continuous-current dynamos and motors of the open and semi-enclosed types, totally enclosed motors, motor starters, and field regulators, alternators, induction motors, storage batteries, transformers, blowers, electric drills, and pumping plant.

**The Electrical Ironmonger.**—On Tuesday of last week a paper was read before the Birmingham branch of the Ironmongers' Association, by Mr. W. E. Milns, of the Birmingham Corporation Electric Supply Department, dealing with the present position of electric lighting and heating, the existing relationship between the ironmonger and the electrical trade, and concluding with suggestions for a closer relationship between these trades. The paper was read in the Supply Department's Show Room, and was followed by a demonstration of lighting and heating appliances.

**English Shorthand Typists from Berlin.**—A considerable number of English lady typists, formerly in the employ of the A.E.G. Company of Berlin, and many of them with a knowledge of French, German and Spanish, in addition to English, and able to write shorthand in all these languages, have been obliged to return to London. Mr. George de Curtis, of the Post Office, Engineering Section, Kingsland Green, N.E., will be pleased to hear from any firms who might desire to avail themselves of their services, as they are seeking situations in this country. In addition to their knowledge of languages, their intimate acquaintance with German commercial methods will also be of great value.

FOR  
BRITISH  
MANUFACTURED  
**PAPER  
INSULATED  
CABLES**

THE  
**UNION  
CABLE  
CO., LD**

DAGENHAM DOCK,  
ESSEX.

## FARADAY HOUSE.

ESTABLISHED 1889.

### IRON AND STEEL TESTS

Faraday House tests every kind of Electrical Machinery and Instrument, and all Apparatus and Materials used by the Electrical and Allied Industries.

Scale of fees will be sent on application to the Secretary.

THE ELECTRICAL STANDARDIZING, TESTING AND TRAINING INSTITUTION, Ltd.,

62-70, Southampton Row, London, W.C.

Telep. No.: 9999 Central.

Telep.: "Standardizing, London."

## FARADAY HOUSE.

### TENDERS INVITED AND PROSPECTIVE BUSINESS

#### Generating Stations, Sub-Stations, Mains, &c.

**Altrincham.**—A loan for street electric lighting purposes is to be taken up.

**Batley.**—A loan of £8,500 is to be taken up for cables.

**London: L.C.C.**—High- and low-tension switchgear and gravity bucket ash conveyor. (See advertisement on another page.)

**Manchester.**—Ten 50,000-lb. water-tube boilers and two 15,000-kw. turbo-alternators are required for the Barton power station. (See advertisement on another page.)

**South Africa.**—The *British & South African Export Gazette* states that large municipal contracts are to be carried out at Cape Town, including £100,000 upon electricity extensions.—An electric lighting scheme is to be carried out at Ladybrand.

**Stockton-on-Tees.**—A supply of three-core cable is required. (See advertisement on another page.)

**Stoke-on-Trent.**—A loan of £2,500 is to be taken up for mains extensions in the Goldenpale district.

**Willesden.**—In order to deal with the Willesden Green district, an additional feeder, at an estimated cost of £4,000, is to be laid.

#### Wiring

**Grimsby.**—Wiring work at Corporation schools during year ending Dec. 31st, 1915. Clerk, Education Offices. Nov. 14th.

**Manchester.**—Old Hall Drive school and caretaker's house, Gorton. Education Offices. Nov. 18th.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bacup.**—Electric lighting of market buildings, police buildings, and Chief Constable's residence.

**Bournemouth.**—Factory, Holdenhurst Road.—Branch library at Westbourne.

**Chester.**—School. Architects, J. H. Davies & Son, 14 Newgate Street.

**Stoke-on-Trent.**—New school at Oakhill (£9,500).

**Wallsend.**—Additions to Infectious Diseases Hospital.

#### Miscellaneous

**Bacup.**—A number of street lamps are to be converted from gas to electricity.

**Edinburgh.**—The Edinburgh & District Tramways Co. require a twelve months' supply of electric lighting stores. General Manager, Nov. 20th.

**Ireland.**—The Sligo, Leitrim and Northern Counties Railway Co. require a twelve months' supply of telegraph materials, lamps, &c. Secretary, Enniskillen. Dec. 1st.

**Spain.**—Three electric cranes are required by the "Junta de Obras del Puerto de Alicante." Further particulars at 73 Basinghall Street, E.C.

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Ipswich.**—The tender of Chamberlain & Hookham has been accepted for a twelve months' supply of meters.

**Maidstone.**—The tender of the Craigpark Electric Cable Co. at £651 for mains has been accepted. The only other tender received was from W. T. Glover & Co., at £700. The new mains are in consequence of additional demands by the Tilling-Stevens works.

**New Zealand.**—The tender of the Brush Electrical Engineering Co. has been accepted for the supply of hydro-electric plant and transformers for Tauranga.

### APPOINTMENTS AND PERSONAL NOTES

Alderman G. H. Robinson, who has been Chairman of the Bradford Electricity Committee, and has been prominently identified with the extensions to the undertakings, has been appointed Lord Mayor of Bradford.

Mr. F. A. Yerbury, who has recently returned from Vancouver, and was formerly with the Mirrlees Watson Co., has become Director and Manager of the Sales Department of the Premier Cooling & Engineering Co., Ltd. (Broadway Court, Westminster, S.W.).

Mr. J. W. Burr, Deputy Electrical Engineer at Croydon, has been appointed Borough Electrical Engineer at Swansea, at a salary of £500 per annum, in succession to Mr. C. A. L. Prusmann. The short list consisted of Mr. Burr, Mr. H. A. Nevill (Chief Electrical Engineer, Wakefield), Mr. S. R. Windle, of Sunderland, and Mr. A. E. Wilson, of Bristol. There were 128 applicants.

Shift engineers are required at the Bedford and Dover Electricity Works. (See advertisements on another page.)

An assistant charge and a junior shift engineer are required in London power stations. (See advertisements.)

A foreman is required in the Tramways Department of the St. Helen's Corporation. (See advertisement.)

Two switchboard attendants, one arc-lamp repairer, one overhead linesman, and one wireman are required in the Newport Electricity Department. (See advertisement.)

Switchboard attendants are also required at the Fulham, Stepney, Birmingham, and other electricity works. (See advertisements on another page.)

A junior switchboard attendant is required for a London sub-station. (See advertisement on another page.)

A sub-station assistant is required at Halifax. (See advertisement on another page.)

## LOCAL NOTES

**Barking: The Ilford Case.**—The Electricity Committee recommends that no action be taken with regard to giving financial assistance in the matter of fighting the Ilford wiring and fitting case, and that the Electrical Engineer make further inquiries and report as to the probable amount of the Council's contributions in respect of the proposed joint Bill of those municipalities requiring wiring or fitting powers.

**Brighton: The L.B. & S.C. Rly. Contract.**—As we have previously mentioned, there has been a certain amount of discontent on the part of some of the members of the Council as to the new contract recently arranged for the supply to the L.B. & S.C. Rly. locomotive shops. These members, who are in a very small minority, succeeded in again raising the question at the last meeting of the Corporation in the form of a resolution asking whether the new terms of the contract with the Railway Co. are likely to give favourable or unfavourable results to the Corporation. It fell to Alderman Gervis, the Chairman of the Electricity Committee, to vindicate once more the action of that body, and judging by local accounts, interest in the matter dwindled towards the end of the debate, as we read in the *Sussex Daily News* that the voting was taken in the presence of only a few members, and that the motion was defeated by 8 votes to 7.

**Derby: Loss of Profits Insurance.**—The Electricity Committee has effected an insurance against loss of profits upon the electricity undertaking arising from fire, boiler, or economiser explosion, or electrical breakdown, and against damages and penalties payable in consequence of failure to supply consumers arising from the same cause. The net annual premium is £88 16s. 6d.

**Dover: Municipal Wiring, &c.**—The Corporation has decided to subscribe £5 towards the costs of promoting a joint Bill by those municipalities requiring hiring and wiring powers.

**London: Islington: Charge for Cinema Supply.**—The Electricity Committee is faced with a difficulty in connection with supply for cinematograph apparatus. At present the charge is 3d. per unit, but the proprietors claim that they should be supplied at the power rate, viz., 1d. per unit. It seems that the Council will be forced to take some action in the matter, as the Gas Light & Coke Co. is offering to install gas-driven generators in these premises, and to guarantee that the total charge shall not exceed 1d. per unit.

**Maidstone: Engineer's Bonus.**—The Council in Committee has decided that the £200 bonus paid to Mr. E. E. Hoadley, the Borough Electrical Engineer, in 1913-14 (see *ELECTRICAL ENGINEERING*, Oct. 22nd, p. 557) has been paid in error, and that Mr. Hoadley be asked to refund it. At the same time, the Electricity Committee is to report as to certain bonuses which it is alleged Mr. Hoadley is entitled to, and which he has not been paid, and also as to a proposed increase in his salary.

**Manchester: The New Power Station.**—It is stated that the Electricity Committee intend to commence work upon the new Barton power station at the earliest possible moment to provide as much work as possible during the winter.

**Oldham: Ornamental Cooling Towers.**—As happened at Edinburgh some time ago, some of the residents near the Greenhill Electricity Works object to the erection of additional cooling towers of the ordinary kind, and have laid before the Electricity Committee sketches of structures intended to be more ornamental. The Committee, however, unlike the Edinburgh Committee, have rejected the proposal on the ground of expense.

**Hiring-Out Motors.**—The Chamber of Commerce have protested against the Electricity Committee supplying motors on hire, and allege that at a recent interview an assurance was given that the Committee would discontinue this practice. The Chairman of the Committee, however, states that the word used was "discontinuance," and not "discontinue," and the case for the Committee is that it never intended not to supply a consumer with a motor if he asked for it, but that the Department would not push the supply in competition with the tradesmen of the Borough.

**Sheffield: Wiring and Fitting.**—The Sheffield electrical contractors are apparently dissatisfied with the manner in which the Corporation is carrying out the agreement come to with the Electrical Contractors' Association after the Parliamentary proceedings last year. It is alleged that the Corporation agreed only to wire to the wall, floor, and ceiling, and that several weeks after this had been agreed to and the Corporation Bill passed, the Town Clerk had

asked for two or three months' further delay before putting the new arrangement into operation. Since then there seems to have been further negotiations, but nothing definite has been arrived at, and the Law and Parliamentary Committee of the Association has been asked to deal with the matter, in order that action may be taken to "put a stop to the existing methods of retail trading." The matter will come before the Corporation in the form of a report dealing with the negotiations between the Association and the Special Committee appointed to deal with it.

**Truro: Electric Supply Scheme.**—Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, held an inquiry at Truro to hear objections to the site of the proposed electric power station. Dr. Purves, the Council's Consulting Engineer, explained that the objections were to probable noise and smell from the works, and said that every protection was being taken to avoid both. The evidence from the ratepayers who appeared was to the effect that their objections would cease if the power station was placed at the other side of the field in which it was proposed to erect it, and the Inspector suggested that the Council might consider this proposal.

**Wrexham: Wiring and Fitting.**—The Town Clerk is to report upon the suggestion of the I.M.E.A. that municipalities should contribute towards the cost of the Ilford case, and also as to the proposed promotion of a joint wiring and fitting Bill.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £52 10s. to £53. (Last week the same.)

**Plant for Sale.**—The Bolton Corporation has for sale a number of second-hand single-phase 83-cycles Brush transformers. (See an advertisement on another page.)

**The British Electrical Export Co., Ltd.**—This Company has been formed under the same directorate as Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street, E.C.), to assist the smaller electrical manufacturers to get in touch with the shipping orders at present on the market that have previously gone to German houses.

**Agency Wanted.**—A Denmark agent is desirous of representing United Kingdom manufacturers of electrical machinery and apparatus. The name is on file at 73 Basinghall Street, E.C.

**Liquidation.**—The Roundhay & District Electric Lighting Co. is to be wound-up voluntarily, having been acquired by the Leeds Corporation.

**Change of Title.**—Ralph H. Haylock & Sons (63 Queen Victoria Street, E.C.) inform us that they are trading for the future under the style of Haylock & Haslett.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Companies Struck Off Register.**—The names of the following will be struck off the register of joint stock companies within three months unless cause is shown to the contrary: Bean Co. (British Electrical & Mechanical Co.); Electrical Power Users' Association; Electric Fire Prevention Appliances & General Mfg. Co.; International Syndicate for Electric Water Power & Public Works Concessions; North Lancashire Tramways Power & Construction Syndicate; Star Electric Light Co.

**Edison & Swan United Electric Light Co.**—There was a net profit of £4,696 for the year ended June 30th, to which is added £1,036 brought forward. This is after providing for both classes of debenture stock and depreciation upon freehold properties and plant. It is proposed to carry forward the whole of the available balance. The directors report very considerable expansion during the past year, and the signs for the next twelve months justify them looking forward to it with considerable confidence.

**Metropolitan Electric Supply Co.**—The interim dividend on the ordinary shares at the rate of 4 per cent. per annum, which was deferred a short while ago in consequence of the war, is now to be paid.

## SUMMARY

MR. P. V. HUNTER's address to the Newcastle Local Section of the Institution of Electrical Engineers discussed some problems incidental to supply on a large scale (p. 596).

MR. J. LOWSON's chairman's address to the Scottish Local Section of the Institution of Electrical Engineers dealt with electricity on board ship (p. 596).

IN a Paper on Cables by Mr. C. J. Beaver, read and discussed at the Institution of Electrical Engineers, a new "intersheath" cable for very high pressures was described, and various other matters in connection with cables and cable testing were dealt with (p. 597).

MR. P. P. WHEELWRIGHT in his address to the Manchester Local Section of the Institution of Electrical Engineers spoke of some of the opportunities afforded to the electrical industry by the present circumstances (p. 598).

A REPORT has been issued by a committee in California on the inductive interference produced in telephone and signal lines running parallel to power circuits (p. 598).

THE Preliminary-Grade Paper in Lundbergs' Electric-Light Switching Competition appears on p. 599.

SOME further notes are given on the effect of the war on the loads of the electricity supply stations throughout the country (p. 599).

MR. JUSTICE JOYCE has held that the patent under which the Walsall Hardware Co. manufacture a grip conduit fitting is invalid for want of subject-matter (p. 599).

THE relative merits of copper leaf and composite

brushes for rotary converter slip-rings are discussed in our Questions and Answers columns (p. 600).

A DISCOURSE by Prof. Fleming on the functions of the earth in wireless telegraphy is referred to under "Telephony and Telegraphy," where notes are given on the equipment of the Goldschmidt wireless station at Tuckerton, and on a "wireless spy" court martial (p. 600).

A PAPER on the economic spacing of traction sub-stations was read last week by Dr. H. F. Parshall before the Institution of Civil Engineers (p. 601).

AMONG the subjects of the specifications published last week at the Patent Office are wireless control of torpedoes, protective systems and electrical treatment of birds and animals. C. A. Vandervell & Co. have been successful in an application for suspension of a patent for magneto construction owned by a German. Application has also been made to suspend an electric welding patent. A patent for helical drawn wire filaments by C. O. Bastian is opposed. A patent for graphitising carbon electrodes expires during the week after a full life of fourteen years (p. 602).

SUGGESTIONS are given for ironmongers to take up the electrical business more energetically (p. 603).

AN electric fire pump, some large alternator field regulators, and a new electric stove are described in our Trade Section (pp. 603 and 604).

A LIST is given of new books on electrical and allied subjects which have been published during the last few months (p. 605).

HIGH- and low-tension cable, transformers, and sub-station switchgear is required at Bethnal Green; generating plant by the Barnet Guardians; and expenditures of £17,700 and £6,500 are contemplated at Keighley and Rawtenstall respectively (p. 605).

THE Long Eaton Council has decided not to carry their case with regard to preferential charging to the House of Lords.—We give the history of the Belfast extension scheme showing how the Corporation has ignored the consistent advice of various experts.—The rateable value system has been adopted at Leeds.—Electric cooking apparatus is to be installed in the Willesden schools (p. 606).

**Arrangements for the Week.**—(To-day) Thursday, Nov. 19th. Institution of Electrical Engineers, Dublin Section, at Royal College of Science. Chairman's Address, by Mr. G. Archer. 8 p.m.

Friday, Nov. 20th. Institution of Mechanical Engineers. "The Effect of Vacuum on Steam-Turbines," by G. G. Stoney, F.R.S.

Wednesday, Nov. 25th. Institution of Electrical Engineers, Birmingham Section. At University. "Power Plant Testing," by W. M. Selvey. 7.30 p.m.

Thursday, Nov. 26th. Institution of Electrical Engineers. "Power Plant Testing," by W. M. Selvey. 8 p.m.—Greenock Electrical Society, 21 West Stewart Street. "The Oscillograph," by J. A. Kinnaird.

## PROBLEMS OF GENERATION AND TRANSMISSION ON A LARGE SCALE

THE Chairman's Address of Mr. P. V. Hunter to the Newcastle Local Section of the Institution of Electrical Engineers was devoted to some of the problems which arise with the prevailing tendency of electric supply and distribution being carried out on a larger and larger scale. Some of the most important of these were due to the mechanical forces experienced by circuits carrying heavy currents. As the magnitude of such stresses was proportional to the square of the current, they might be quite inappreciable with normal currents, but of serious moment in event of an abnormal rush of current amounting to several times the normal load. Trouble was first experienced due to this cause in the end windings of turbo-generators, which had been seriously distorted and damaged in this way by sudden short-circuit currents. The effect, however, depended largely on the nature of the short-circuit; a growing fault sometimes allowed the armature current to demagnetise the field sufficiently to avoid excessive currents in the stator windings. The primary precaution was to brace the end windings in a way to enable them to withstand the mechanical forces. Sometimes reactance had been introduced in series with the generator windings to reduce the maximum short-circuit current; or the step-up transformers, where these were used, were made of specially high impedance; but there was still the objection that if these devices broke down, the generator was still unprotected. No really satisfactory way of incorporating sufficient reactance in the stator windings themselves had been evolved, although there was a tendency on the part of some designers to depart from the ideal winding of one bar per slot. This, however, was attended by other disadvantages. "On the whole," continued Mr. Hunter, "it seems justifiable to express the view that with the precautions discussed above the mechanical shock on short-circuit is no serious obstacle in the construction of large generators, and it does not appear at all probable that it will in any way limit the maximum size of generators which can be satisfactorily constructed."

Transformers were subjected to great stresses due to the same cause to an even greater extent, but, owing to their construction, were better able to withstand them. It had been found, however, from experience that, although a transformer may be so constructed and braced that when first installed it is fully capable of withstanding a short-circuit, it may not be in this condition after it has been in service for a few months. This particularly applies to oil-cooled transformers, where apparently there is some slight shrinkage of the insulation due to the action of the hot oil. Many existing transformers have inadequate provision against these mechanical stresses, but that more trouble has not been experienced is probably due to the fact that the generating plant was not able to maintain the full primary pressure on short-circuit. There is little doubt that many failures of current transformers have been due to the same cause. Another way in which minor forces have manifested themselves is in the spontaneous opening of disconnecting switches of the knife type on heavy current rushes. Indeed, no conductors in large stations are immune from these forces, and measures must be taken to provide against damage. One precaution that may readily be taken when the conductors are in the form of copper strip is to arrange them so that the greatest dimension of each conductor's cross-section is in the line of the force. This obvious precaution gives greater rigidity, but is often neglected.

In addition to precautions in the nature of mechanical construction to enable these stresses to be taken without harmful strain, it is desirable to endeavour to reduce their magnitude, and a good deal can be done in this direction by the use of reactances to limit the short-circuit currents. This has been discussed a good deal lately, and in some cases the indiscriminate use of reactance has been advocated in a manner which, if adopted, would make commercial engineering practically impossible. So far as generators are concerned, the addition of even a comparatively large reactance does not materially affect cost or efficiency, but the introduction of reactances between bus-bar sections and on feeders had the disadvantage of entailing too much sub-division of the network. The objection to the use of reactance at the power station end of feeders is the increased voltage drop. This is not serious in undertakings such as were common in America where synchronous converting plant enable a high power factor to be obtained, but is more serious in this country, where the tendency is to give supply as alternating current without conversion. Mr. Hunter suggested that the most satisfactory solution to the problem in this case was to put on each feeder a voltage regulator which might embody the necessary reactance.

## ELECTRICAL EQUIPMENT ON BOARD SHIP

THE Chairman's Address of Mr. J. Lowson, delivered at Glasgow on Nov. 10th to the Scottish Local Section of the Institution of Electrical Engineers, was devoted to a study of the applications of electricity on board ship. Progress had been continuous ever since Edison, in 1880, had fitted 115 10-c.p. lamps on the s.s. *Columbia*, supplied by two dynamos belt-driven from a countershaft. Some months later the Cunarder *Servia* was fitted with a 10-kw. installation, and in 1883 the *Nonpareil* was electrically lit by J. H. Holmes & Co. The White Star liner *Majestic*, of 1899, had 1,200 16-c.p. lamps, and at that time it was considered remarkable that the exposed navigation lights and compass lights were electric. The first insulated wires used for ship lighting were covered with cotton cloth and white lead, and were provided with a further protection of rubber tubing when passing through specially damp places. There had been some difficulty in finding wires and fittings that would not be affected by sea-air or sea-water, and no matter how good the insulating material and armoured protection, if the wires are not well fitted by competent men deterioration quickly sets in. An electrical installation, however, carried out in a proper manner, should last as long as the hull of the ship. Few electric motors were used on board ship ten years ago, and a decided advance was made on the *Lusitania* and *Mauritania*, in 1907, when electric drive replaced steam engines for force-draught fan driving, and in all motors aggregating 2,133 h.p. were installed on each ship. Even the life-boat winches were worked electrically, but electricity was not used to any great extent for cooking and heating. There was still a large field for future extensions in this direction, where its advantages render its universal adoption only a matter of time. The thermo-tank system of ventilation, with electrically-driven fans, was very largely in use, and an electric water-heating device for cabin basins, &c., had been introduced by a Glasgow firm. Although it was a difficult matter to oust the steam winch from its present position, Mr. Lowson looked forward to the time when the electric winch would be so improved as to be preferable on all counts, in view of the fact that electric cables had many advantages over steam pipes on board ship. Where the forced-draught fans were driven electrically, the use of electric power for winches, cranes, &c., in port would greatly improve the load-factor. The advent of oil-motor-driven ships would make electrical auxiliaries imperative; but at least one steam-propelled ship, the G.S.N.Co.'s *Fauvette*, had recently been equipped with a complete set of electric cranes for discharging and loading cargo. The Chairman then referred to Mr. H. A. Mavor's experiments in electrical marine propulsion on the Tyne, but regretted that the enterprise could not be proceeded with on the lines intended, owing to rise in the price of fuel oil.

The latter part of the address contained an account of the electrical equipment of the *Aquitania*, which involves generating plant consisting of four 400-kw. turbo-generators for 225 volts D.C., with static balancers for three-wire distribution, and a 30-kw. emergency Diesel-engine-driven set, 200 miles of cables and a power equipment of over 200 motors, aggregating 2,590 h.p. (including 700 h.p. for forced draught), and varying from  $\frac{1}{2}$  to 50 h.p. Over 10,000 metal-filament lamps are used for lighting, including ten 300-c.p. life-boat lamps along each side. There are also four 100-ampere searchlights. Other applications of electricity are in connection with the fire alarms, watertight doors, submarine signalling, sounding machines, navigation and side-light indicators, signalling lamps, whistle control and helm indicators, revolution and stoking indicators, clocks, telephones, and bells, and the wireless telegraph system, including wireless installations on two motor life-boats.

**The British Electrical Federation and the War.**—As we have already pointed out the British Electrical Federation Mutual Aid Fund has been inaugurated in order to assist dependents of the men employed by the various companies affiliated to the Federation who are at present with H.M. Forces. The Federation urges all its eligible employees to enlist, and pending the decision of the Government on the question of increased pensions, the allowances to dependents who have lost their lives in action are being continued. Out of 7,432 men no less than 757 have already enlisted. These figures do not apply to the Metropolitan group of companies, including the Underground Railways, for which the T.O.T. Mutual Aid Fund has been established. We regret to notice that already four men have lost their lives. There is the substantial balance in hand of £621, and the balance of weekly income over expenditure is at present approximately £80.

**The Physical Society.** The Council have decided not to hold the usual Annual Exhibition of Apparatus during the present session.

## CABLES

A PAPER on "Cables," by Mr. C. J. Beaver, of Messrs. W. T. Glover & Co., was read at the Institution of Electrical Engineers in London on Thursday, and at the Manchester Local Section on Tuesday; it will also be discussed in Edinburgh on Jan. 12th.

Dealing first with extra high pressure cables, Mr. Beaver commented on the fact that cables up to 11 kilovolts pressure were standardised by the Engineering Standards Committee, so that it was only for higher pressures that there was an incentive to give attention to potential gradients, as there was greater margin for competition in unstandardised cable. From 6 to 11 kilovolts, however, he said that the opportunity for re-designing dielectric thicknesses had been apparent years ago, but nobody had had the courage or the opportunity to reverse the practice of increasing the thickness of the dielectric as the size of the conductors increased.

For cables for from 50 to 100 kilovolts the author pointed out that a tubular conductor is necessary. Fig. 1 shows such a conductor designed for a 50-kilovolt cable, allowing a maximum stress in the dielectric of 50 (R.M.S.) kilovolts per cm. To give the necessary diameter and smoothness of surface it is made up of an inner lead tube 0.256 in. bore and 0.14 in. radial thickness, surrounded by twenty-four copper wires 0.082 in. diameter, which are covered by a lead sheath 0.05 in. thick, bringing the total diameter of the conductor to 0.80 in. Fig. 2 shows an alternative pattern for cables protected on the split conductor system (ELECTRICAL ENGINEERING, Oct. 22nd, p. 551); it is made up as follows: Inner conductor 19/15 S.W.G.; paper, 0.117 in. radial; second

FIGS. 1 AND 2.  
(Actual size.)

FIG. 3.  
(Half actual size.)

conductor, 30 × 0.058 in.; outer lead, 0.05 in. radial; complete diameter, 0.80 in.

In designing the dielectric, the author prefers to interpose an intermediate metallic sheath in the dielectric instead of insulating with layers of varying specific inductive capacity. The "intersheath" is anchored at a suitable predetermined potential by a transformer tapping in the case of A.C. cables, or by a tapping from the generators or by connecting resistances in parallel in the case of D.C. He prefers one intersheath instead of two, as, although the latter introduces a small saving in the total diameter of the cable, this is more than compensated for by the extra complication of the apparatus which would be required to keep two intersheaths at the proper potential. Fig. 3 shows a single intersheath cable, of which commercial lengths have been made and tested with satisfactory results. It is designed as a member of a 100-kilovolt three-phase line, and for a breakdown pressure of 250 kilovolts per phase. The maximum stress in the dielectric at working pressure is 52 kilovolts per cm. The dimensions are as follows: *Conductor*: Inner lead tube, 0.27 in. bore and 0.06 in. radial thickness; 19 × 15 S.W.G. copper wires; outer lead tube, 0.05 in. radial. *Dielectric*: Paper, 0.545 in. radial; lead intersheath, 0.05 in. radial; second paper sheath, 0.565 in. radial. *Outer Lead Sheath*: 0.16 in. radial. Overall diameter, 3.27 in. He regards a breakdown stress of 250 R.M.S. kilovolts per cm. as the maximum commercial figure in the present state of the manufacture of paper cables, and takes from 120 to 150 as a safe figure for the purposes of the guaranteed tests. As these are likely to be two-and-a-half to three times the working pressure, this gives a working maximum stress of about 50 kilovolts per cm.: at 60 to 70, the heating due to dielectric hysteresis would be appreciable.

The author insisted on the importance of the time element in pressure tests, as sometimes cables break down near the expiration of the standard half-hour period. He mentioned the divergence of views between Addenbrooke and Rayner

on the one hand, and Hochstädter on the other hand, as to whether the dielectric broke down gradually or suddenly, and seemed inclined to the latter view, expressing the opinion that the gradual increase in the current through the dielectric observed by Rayner had been the effect of the rise in temperature on the dielectric. In connection with the test under water, he pointed out that it takes very long for the water to penetrate thick insulation, and owing to the path of least resistance to the water being longitudinal, there is a risk of the moisture travelling a long way along the cable before it is detected. He has used in some cases, therefore, a "test sheath," insulated only from the lead covering by a comparatively small radial thickness of insulation, so that a defect in the lead sheathing may be detected at once.

In the second part of the Paper the author touched on the method of insulating paper cables, and emphasised his point of view that a higher insulation did not necessarily indicate overheating in manufacture, as, in a certain make of cable in which the paper is applied to the cable after impregnation, a higher insulation, he said, was obtained than in those in which the impregnating process took several hours after application of the paper. He strongly advocated the impregnation of the paper in sheet, before its application to the cable.

The necessity for allowing for expansion and contraction of laid cables was referred to, and the point that much higher current densities can be permitted in underground cables than those allowed by the Institution Wiring Rules. The importance of using ferrules designed in bold curves and a smooth finish after soldering, in conductor joints in E.H.T. cables was alluded to, and the author expressed his preference for the use of porcelain spacers for insulation rather than wrappings of tape and paper. On the subject of mechanical faults, he mentioned a case in Manchester where it had been found that the pounding of heavy traffic had depressed the joints between the lengths of troughing, and caused faults; cables on the solid system are particularly susceptible to this form of damage.

Dealing with rubber cables, he classed deterioration of the insulation as a superficial effect, and inferred that E.H.T. cables with thick dielectrics would be more durable.

The last part of the Paper was devoted to vulcanised bitumen cables, and the author described in detail the various mechanical tests to which the insulation of these is now subjected. After describing at length an interesting investigation upon some failures of V.B. cables in the tropics, he came to the conclusion that leakage current was necessary in the first instance to produce softening of the dielectric. Finally, he described successful experiments in which the addition of high-grade vulcanised rubber, incorporated in the vulcanised bitumen as a filling, had a distinctly beneficial effect in preventing the same class of softening as was produced by exposure to steam, and mentioned the addition of 5 to 10 per cent. of the rubber substance as being sufficient under the worst conditions of practice.

The discussion in London was chiefly devoted to the "intersheath" cable. Dr. Alexander Russell (Faraday House) said that he was now convinced that this was a better solution of the problem than the Jona method of grading, which had the disadvantage that it assumed that the specific inductive capacity of the dielectric remained constant. He pointed out that the capacity currents in the outer sheath would be large, but so far as the intersheath was concerned, the currents on the two sides of this would largely neutralise one another. For long cables, as had been explained to him by Mr. L. B. Atkinson, the capacity current in the outer sheath could be dealt with by feeding current into it, but for short lengths this was unnecessary. He regarded the method particularly suited to H.T. D.C. cables. Mr. Rayner (National Physical Laboratory) suggested paper or something less expensive and heavy than lead for the internal tube of the cable. He also expressed his disagreement with the author's interpretation of his breakdown experiments on cables and maintained that the effect noticed was a real drop in ohmic resistance and not a temperature effect. Mr. P. V. Hunter (Newcastle-upon-Tyne Electric Supply Co.) thought that the cable described would be limited for various reasons to connections to the ends of overhead lines and similar applications. For long cables, there would be trouble due to the high capacity current, increased reactions due to the distance between the conductors, as single cables would have to be used, and a revival of the "Ferranti effect" in which the reactance voltage due to the leading current added considerably to the working voltage. Moreover, if the lead sheaths of two cables in a three-phase system touched, heavy currents might flow. He also feared that the auxiliary apparatus to "anchor" the potential of the intersheath would make the conditions worse from the point of view of possible surgings. Prof. Schwartz said that as a result of seven months' experiments in conjunction with Dr. H. P. Stevens, he had found that the natural deterioration of plan-

tation rubber was no greater than that of fine hard Para. Mr. F. C. Raphael (Editor of *ELECTRICAL ENGINEERING*) explained that a breakdown of the author's intersheath cable at any spot might be expected to cause breakdowns in other points of the cable, due to full pressure being established between the intersheath and the core or the outer lead, and heavy currents might also, in such circumstances, pass along the intersheath and melt it, so damaging considerable lengths of cable. A single fault could be localised with an accuracy of one yard per mile of cable, but it was impossible to localise accurately several simultaneous faults in the same cable. An advantage of the split conductor system of mains protection was that a faulty cable would be automatically isolated before the conductor had had time to burn through, so the localisation would be possible. Mr. Brooking (St. Helens Cable Co.) said that the natural deterioration of vulcanised rubber did not occur in a certain class of cable, which was "as permanent as the pyramids of Egypt." Mr. C. P. Sparks (County of London Electric Supply Co.) referred to the good results obtained with the vacuum cable joint; he objected to the mechanical weakness of porcelain spacers and preferred a joint with carefully prepared insulating material, covered by a wiped sleeve joint. He disagreed with the last part of the Paper. Vulcanised bitumen, he said, had proved a treacherous material in the past, and should therefore only be used in special circumstances. Prof. J. T. Morris, Mr. Addenbrooke, Mr. Wordingham, and Mr. S. W. Melsom also spoke briefly. In his reply to the discussion, Mr. Beaver said that many of the criticisms had been made on the assumption that the intersheath cable was proposed for long distances, but so far it was only being employed for short ends connected to overhead lines.

## THE ELECTRICAL INDUSTRY AND ITS OPPORTUNITIES

IN his inaugural address to the Manchester Local Section of the Institution of Electrical Engineers, Mr. P. P. Wheelwright dwelt on the business side of the Institution's work, urging a widening of its field of operation, particularly as regards improving the status and remuneration of electrical engineers. Turning to the influence of the war on electrical industry, he encouraged all effort to take the opportunity now presented of securing trade which formerly passed to Germany, and the directing of patriotic energy into defence of our industries as well as our country. He looked forward to economic advantages in the further adoption of electric traction on railways, and put in a plea for a sounder basis in the specifying and purchase of electrical plant, with more give-and-take between the purchaser and the manufacturer. He also spoke of the economies to be effected by electrical driving, its advantages in the way of smoke abatement, and the keynote of his address was the appeal to seize all the opportunities of the present for effecting the progress of the British electrical industry, and the full utilisation of the benefits it can render available in other spheres of activity.

**The Lighting of the Lecture Theatre at the Institution of Electrical Engineers.**—As Sir John Snell announced at the meeting last Thursday, experiments are being made regarding improvements in the lighting of the lecture theatre at the Institution of Electrical Engineers. The original lighting installation, which is on somewhat unusual lines, was described in *ELECTRICAL ENGINEERING*, Vol. VI., p. 728 (Nov. 17th, 1910), and, as those familiar with the building will know, consisted of indirect lighting by metal-filament lamps in the cornice, with the addition of four quartz mercury vapour lamps above the glass "lay light," forming the main part of the ceiling. It has been customary while the lantern is in use to extinguish only the indirect lights, as the peculiar coloured light from the mercury vapour lamps interferes but little with the definition on the screen, while sufficiently bright to read by and to take notes. The experiments now being made are in the direction of replacing some of these by lights of other natures, and trying the effect of various coloured screens. The difference in the illumination could not but be apparent to those who were at the meeting, and the illumination of the hall has been greatly improved, both in intensity and character. We are informed, however, that no final result has been arrived at, and that the arrangement then used will not necessarily be adopted. For this reason we are unable to give details of the lamps that are being tried until the experiments are complete.

**"The Central."**—Among the articles in the current issue of the magazine of the old students of the City and Guilds Engineering College is one by Mr. A. C. Branch on the commercial aspect of Diesel engines. The doings of old Centralians are chronicled in the usual notes, but there is curiously little as to their participation in the war.

## INDUCTIVE INTERFERENCE OF PARALLEL CIRCUITS

A REPORT has been issued by a Committee of the Railroad Commission of the State of California, U.S.A., which was appointed to investigate the question of inductive interference between different classes of parallel circuits. After a considerable amount of experimental work, the Committee summarise their conclusions as follows:—Interference to telephone circuits under normal operating conditions of power circuits arises almost wholly from the harmonic voltages and currents of the power system. The effect of induction of the fundamental frequency on telephone circuits is comparatively unimportant unless it is of magnitude sufficient to constitute a physical hazard. Interference to telegraph and other signalling circuits is due principally to the fundamental and lower harmonics. The power circuit currents and voltages may be divided into two factors: balanced and residual, of which, for equal magnitude, the latter in general produce the greater inductive interference. Inductive interference to communication circuits, arising from the balanced voltages and currents can in a large measure be prevented by means of an adequate system of transpositions applied to both power and communication circuits (assuming the latter are metallic) and located with due regard to each other. Abnormal conditions and at times switching operations produce transient disturbances of a very severe character.

A code of rules is recommended for the avoidance of harmful inductive effects. Some of the chief points to which attention is paid are the following: Every effort should be made to avoid parallelism, but parallel lines will be permitted if various precautions are taken. The minimum horizontal separation in such cases should be at least equal to the height of the power line, and the currents in the phases of the power circuit must be as evenly balanced as possible. An adequate system of transpositions must be provided both for the power and communication circuits to balance the electrostatic capacities to earth of its several conductors. No earthed single-phase or earthed neutral three-phase transformer connections may be employed, and only oil-switches with the three poles opening simultaneously may be employed. Power circuits must not continue running under abnormal fault conditions, and certain precautions and procedure are recommended in such cases. Care must be taken to eliminate disturbances so far as possible when charging electrolytic lightning arresters, and the wave forms must be as near to a pure sine curve as possible. With regard to single-phase railways, the report continues as follows: "It is recognised that railroads operating alternating-current trolleys with ground return create serious inductive interference with parallel communication circuits. In the present state of the art no means for completely overcoming inductive interference from such parallels is known."

## A GRIP CONDUIT FITTING PATENT ACTION

JUDGMENT was given by Mr. Justice Joyce on Tuesday in the action by the Walsall Hardware Manufacturing Co. against the Stella Conduit Co., Ltd., dealt with on p. 560 of our issue for Oct. 29th. The action was for alleged infringement of Patent No. 18,375/05, for a grip conduit fitting. The Stella Co. admitted infringement, but claimed that there was no subject-matter in the Patent, as the device was nothing more than the grip universally used on bicycle heads. On the other hand, for the plaintiffs it was contended that the patent was a new application of this device, inasmuch as it applied the grip to two ends of a tube, whereas in the bicycle it was only applied to one.

Mr. Justice Joyce, in his judgment, said the main question before him was whether it was a patentable invention to place this common arrangement at both ends of a tube, socket, bend, &c., and he found it impossible to come to any other conclusion than that there was nothing in the patented article in this case which could be termed invention within the meaning of patent law. He therefore must hold that the patent was invalid for want of subject-matter, and dismissed the action with the usual costs. A stay of three weeks was granted on the usual terms to give an opportunity for this judgment to be appealed against.

**An Electrically Propelled Warship.**—As a result of the very successful trials of the U.S. naval collier *Jupiter*, which is fitted with electrical transmission for main propulsion, and has shown remarkable results on an extended voyage, the U.S. Navy Department announces that the new super-Dreadnought *California*, with a designed speed of 21 knots, is to be electrically propelled. This will be the first warship to be equipped on this system, and the result will be watched with great interest.

## LUNDBERGS' ELECTRIC-LIGHT SWITCHING COMPETITION

(For Initial Announcement, and Particulars of Prizes, etc., see "Electrical Engineering" of Nov. 12th, p. 587.)

### RULES TO BE OBSERVED IN WORKING PAPERS.

1. Three Papers are set: Preliminary, Intermediate and Advanced. Any one of the three papers may be taken, but not more than one. The Preliminary Paper is published below; the Intermediate Paper will appear in "Electrical Engineering" of Nov. 26th, and the Advanced Paper on Dec. 3rd.
2. Competitors who have passed the Preliminary Grade on a previous occasion must take either the Intermediate or Advanced Grade. Those who have passed the Intermediate Grade must take the Advanced Grade. Those who have passed the Advanced Grade cannot enter.
3. When figure or page numbers are mentioned in the questions, they refer to the booklet "Lektrik Lighting Connections" (new 3rd Edition \*); by the help of which the paper may be worked.
4. Each answer must be done on a separate sheet (or sheets) of paper, on one side only; and each sheet must bear the writer's full name and address. It is not necessary to paste the questions on the answer paper.
5. Each answer must be numbered to correspond with the question.
6. Any competitor who does not wish his own name to appear in the published results should give a *nom-de-plume* or fancy name for this purpose. In all such cases, however, Rule 4 must be adhered to. In the published results only the names (or *noms-de-plume*) and the towns (not full addresses) of successful candidates will be published.
7. Answers to Papers must be addressed to the Editor of "Electrical Engineering," 203, Temple Chambers, London, E.C. Those from competitors living in or near the United Kingdom must reach the Offices of "Electrical Engineering" on or before Jan. 11th next, and the results will be published in "Electrical Engineering" of Feb. 25th, 1915. Answer Papers from far-off competitors must reach the Offices of "Electrical Engineering" by June 1st, 1915, and the results will be announced later.
8. The answer papers sent in will not be returned.

### PRELIMINARY-GRADE PAPER.

As many as possible of the following eight questions should be answered.

1. A "Twinob" switch may be so connected to two lamps (or groups of lamps) A and B, that B cannot be lighted without A, although A can be put on alone. Sketch the connections.  
Can you think of any use for this control?
2. Before wiring-up, it is necessary to ascertain which is the feed terminal of an "All-or-Part-and-off" switch. How would you do this? What would be the result of connecting the feed wire to the wrong terminal?
3. Make a plan of a large room with two cupboards in it, and show how you would run the wires in the room for Circuit No. 5.
4. The switches in Figs. 72 and 91 are mounted side-by-side at the door of a room, and all the lamps are fed through one ceiling-rose. Three of the lamps are on a pendant 4-light fitting, and the other is on a table standard connected through an adapter to one of the lampholders on the pendant. Sketch the connections.
5. Three lamps on a pendant hung from a ceiling-rose are controlled by a two-way switch fitted to the lower part of the pendant, and by another two-way switch at the door. Sketch the connections.
6. A group of lights is controlled by a single-way cord-pull switch like that in Fig. 23. It is now desired to replace this switch by a two-way actuated in the same manner; and to fix a second two-way switch and an intermediate switch to act in conjunction with the first. The two additional switches are to hang from ceiling-roses, and original wiring is not to be disturbed. Map out the connections.
7. Rearrange Fig. 91 to provide for the looping-in of the distribution box leads to the rose, for separate wires to the switch, and for the earthing of the pendant fitting on which the lamps are mounted.
8. Unless the moving contact-arms of a two-way

switch are insulated from each other, as in the Lundberg "Pivot" and "Imp" patterns, (a) the switch has generally only a single instead of a double break, and (b) the arm which is "off" is liable to develop an "earth" through the cover, or to make the latter "live." Prove these statements.

N.B.—Samples of any of the switches, &c., referred to can be supplied to competitors at the average rate of 2s. 6d. each. Requests for samples must be accompanied by remittances, and must be sent direct to A. P. Lundberg and Sons, Switch Specialists, 477-489 Liverpool Road, London, N. The money will be returned when the samples are sent back in good condition. Mention Competition when ordering. The above is an outside price as regards most switches, and a considerable reduction can generally be made when competitors desire to retain the switches.

## THE EFFECT OF THE WAR ON THE ELECTRICITY SUPPLY INDUSTRY

SINCE publishing our article on this subject last week reports have come in from some other centres.

*Birmingham.*—There was a falling off in the number of units sold in August and September, but in October the totals were practically normal again. Although the traction units sold for October had fallen to 1,964,917 as compared with 2,049,088 in October, 1913, the total units sold during October, 1914, was 7,089,387 as against 6,415,592 in October, 1913. The lighting units have, as might be expected, not shown their normal increase this autumn, but a large number of power users are working day and night on Government contracts.

*North Metropolitan Electric Power Supply Co.*—The chief drop has been in current sold for electric traction. For the week ending August 1st, the number of units sold for traction were 3.5 per cent. above those for the corresponding week last year, but for the week ending October 31st, they were 8 per cent. less than the corresponding week last year.—The lighting and power supply has, however, increased, so that the total falling off is only 3.2 per cent. This means, however, a considerable increase in the lighting units, as the majority of the units sold are for traction purposes. The increase in lighting and power, although great, has been less than it would have been normally.

*West Ham.*—The consumption for public lighting has been largely reduced, but when war broke out, the Electricity Department were engaged in replacing all the old lamps by an improved system of incandescent lighting on tramway poles. The result is that, although the normal lighting has been immensely reduced by the restrictions of the authorities, there has been a safer illumination than before in many of the principal thoroughfares from the point of view of traffic. Private lighting only shows a moderate advance, owing to the decrease in outside shop lighting, but power, heating, and cooking continues to increase satisfactorily. Whilst a few factories have been adversely affected, the majority have become distinctly busier. The total figures for consumption, however, are not much, if any, below the normal rate of advance.

*Gillingham (Kent).*—As this is a military and naval town, it was recently put under very stringent regulations with regard to visible light, otherwise things are normal. The power load is steadily increasing, and applications from new consumers are quite up to the usual number.

*South Shields.*—For the last three months the lighting units are down 6 per cent., the D.C. power and traction units are up 5 per cent., and the total units are up 0.7 per cent, compared with the same period last year. The normal increase all round would have been about 10 per cent. Owing to early closing and restrictions as to public lighting, the lighting supply has increased only 2½ per cent. One hundred arc lamps are out of commission, and the street lighting is dependent on incandescent lamps on the arc lamp standards. The whole of the front of the town overlooking the sea is in absolute blackness all night long.

*Eastbourne.*—For September the output was 9 per cent. less, and for October 8 per cent. less, than last year. The sea front is very effectively darkened, but chiefly by blackening the globes, as only half the lamps are shut off. The remainder are switched off at 10.30 p.m. instead of burning all night.

**Responsibility for Junction Box Explosion.**—Last week an appeal was heard by Justices Darling and Sankey in a case brought by a Mr. Goodbody against the Poplar Corporation for damages for injury due to an explosion of gas in a junction box. The case had gone against the plaintiff in the County Court. Mr. Justice Darling found that the damage was due to the presence of gas in the box over which the defendants had no control. Mr. Justice Sankey agreed, and remarked that the plaintiff might have proceeded against the Gas Co. The appeal was dismissed with costs.

\* For the convenience of our readers we have arranged to keep a stock of this Booklet, and a copy will be sent by return of post on receipt of seven penny stamps. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203, Temple Chambers, London, E.C.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,417.

I wish to construct a suitable search coil for fault localising, and should be grateful if anyone will furnish me with particulars of wire to be used and the gauge and length required to give an audible buzz when passing about 10 amps. through the fault by means of an interrupter, and also the resistance of a "buzzer" to suit.—"ALPHA."

(Answers must be received not later than first post Thursday, Nov. 26th.)

### ANSWERS TO No. 1,415.

The querist is interested in the running of rotary converters, and would like to hear of the experiences of station engineers with regard to the behaviour of the A.C. brushes and slip rings.

In the last year or two the tendency has been to use brushes of a metal-carbon mixture in preference to the copper-leaf brushes invariably fitted to the earlier machines. Some of these earlier machines, if not most, ran for many years before renewal of the slip-rings became advisable, but the writer has known of several machines, using composite brushes, where the wear has become a serious matter. It would be interesting to hear the opinions of engineers with both types.

The trouble, if it is general, may not be due to the material of the brushes, as excessive current density may count for a great deal, but there may be something in it, as the writer believes that there are one or two corporations who insist on having copper-leaf brushes. A. G. T. C.

The first award (10s.) is given to "C. S. B." for the following reply:—

Every station engineer who is in charge of rotary converters is fully alive to the necessity of paying particular attention to the slip rings to ensure satisfactory running. The writer has had experience with the use of both types of A.C. brushes, viz., copper foil and metal-carbon composition, and is decidedly in favour of the latter type.

Copper foil brushes, in many cases, work very satisfactorily, but in practically all these instances great care is taken to clean and trim the brushes regularly. The writer examined recently a 600-kw. rotary-converter, fitted with copper foil brushes, which has been working practically continuously for nearly four years and the slip rings have not yet been turned up, the maximum wear being less than  $\frac{1}{4}$  in. In this case the brushgear is fitted with small lubricating cups, one to each ring, and oil is fed by means of wicks. It will usually be found that where oil or other lubricant is applied to the rings at irregular intervals, and dust is allowed to get between the faces of the copper brushes and the rings, the wear will be excessive. If the rotary is started up by a controller connected to tappings on the transformer, the difficulties of keeping copper foil brushes in order are greatly increased; the rush of current at starting and when switching to "full on" position frequently causes momentary sparking and pitting of the rings. With regard to the use of metal-carbon composition brushes, when excessive wear is taking place, it will be found that this is more often due to excessive brush tension, or else too high a current density resulting in the

rings running hot, than to the actual composition of the brush. A special grade of copper morganite brush, designed for high speed rotaries, is on the market. The normal current density of this brush is not as high as the metallic type for ordinary slip rings, but the coefficient of friction is lower. The writer believes that the most suitable design, both from the point of view of attention required and life of rings, is box-type carbon or graphite-metal composition brushes, working at a fairly low current density, and with just sufficient brush tension on the rings to prevent sparking.

The second award (5s.) is given to "A. J. B.," who writes as follows:—

The relative merits of copper leaf and the more modern composite carbon brush is a much contested point, and good results have been obtained with both types.

Personally, the writer favours the carbon and copper type manufactured by the Morganite Crucible Co. Properly designed with regard to current density, these brushes give excellent results. The trouble experienced by some users is a fine copper dust from the brushes, which is drawn into the rotor connections, and if not frequently cleaned will give rise to serious trouble. This trouble can, however, be removed by the application of a little vaseline every few hours to the slip rings. When machines are fitted with an oscillator on the shaft, no trouble will be experienced with uneven or rapid wear of the rings.

The older form of copper leaf brushes, according to the writer's experience, result in wearing the ring unevenly, due to the fact that it is almost impossible to obtain uniform tension over the whole surface. An oscillating shaft will not remedy this, although it greatly improves wear on both brushes and rings. The best method, when using this type of brush, is to have a double set of brushes and change them, say, twice a week, trimming a new face and thoroughly cleaning each time. Machines with this type of gear are usually fitted with lubricators. The best oil for the purpose is a light thin oil; that which is supplied for transformers is found to give very good results.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

At a meeting of the Wireless Society of London, last Friday, Prof. J. A. Fleming gave an Address on "The Function of the Earth in Wireless Telegraphy," illustrated by experiments for the performance of which it had been necessary, as Mr. A. A. Campbell Swinton, who was in the Chair, announced, to obtain the permission of the Government, even though they involved no transmission or reception of external messages. Speaking after the Address, the Chairman referred to the question of watching for attempts at wireless communication by unauthorised persons, and mentioned an offer of assistance which their Society had made. He did not, when making the offer, know what was being done by the authorities in the matter, but had since been informed of the arrangements, which he declared were admirable in their sufficiency. There was, however, another way in which their members could help. The police were naturally handicapped in their work of suppressing illicit wireless by the fact that many members of the force did not know wireless apparatus when they saw it, and he was now preparing lists of members of the wireless societies all over the country for the use of the police, so that they could at any time and place readily invoke the skilled assistance that they were in need of. He had already done some work of that nature himself for Scotland Yard, and found it quite exciting.

Prof. Fleming, in his Address, investigated the depth to which electric waves can penetrate substances of different conductivity and permeability, illustrating the very skin-deep nature of high-frequency conduction by experiment, and the way magnetic materials absorb the oscillations. Thus the thin zinc coating produced by galvanisation was sufficient to turn iron from an unsuitable to a suitable material for an aerial. The materials forming the earth's crust were mostly of the nature of poorly conducting dielectrics, allowing greater penetration of the waves, but producing horizontal as well as vertical attenuation greatest with dry soil and least with sea-water. Recent research had shown that the conductivity of most substances was, however, higher for high-frequency A.C. than for D.C., and probably vastly so at radio-telegraphic frequencies. The foot of the radiated wave where it penetrated the earth was refracted, a considerable horizontal com-

ponent was produced which gave rise to a surface wave which he suggested might contribute to the result as well as the aerial wave. Indeed, the phenomena of antenna-less reception might be due to this cause alone. A simple experiment illustrated this aspect of radio-transmission. The lecturer also dealt with the curving of long-distance waves to follow the curvature of the earth, attributing it in a small degree to diffraction and largely to the presence of light gases, such as hydrogen and helium, in the upper strata of the atmosphere, which caused the top of the wave to travel faster than the foot. The ionisation of the upper air might also, as suggested by Dr. Eccles, have something to do with it. Indeed, the circumstances fitted together in a way which pointed to the earth being the only planet upon which long-distance wireless telegraphy was possible.

The Tuckerton wireless telegraph station in New Jersey is now, in addition to Sayville (the equipment of which was described in *ELECTRICAL ENGINEERING*, Oct. 29th, p. 563), receiving wireless messages direct from Germany to America. Its interest lies in the fact that the Goldschmidt system is used, and it is from the Goldschmidt station at Eilvese, near Hanover, that messages are being received. The Tuckerton station, of which some particulars are given in the *Electrical World*, had been in experimental operation some months before the war, but on the outbreak of hostilities complications arose on account of the licence for the station being owned by Germans, and the station was taken over by the U.S. Navy Department. On Sept. 15th, however, the main high-frequency alternator broke down, and the station was closed as regards the sending of messages. A new alternator was immediately ordered from Germany to be shipped through Holland, and in the mean time a continuous-wave arc generator was used until an alternator from California had been installed for temporary use. The original equipment was practically a duplicate of that at Eilvese, and included an alternator of about 100-kw. output, with a 3-ft. rotor, with 300 poles driven at 4,000 r.p.m., thus giving a fundamental frequency of 10,000 cycles. By the well-known Goldschmidt "reflection" principle of reinforcing the harmonics by resonance and cascade, superposed frequencies of 20,000 and 30,000 cycles are obtained. The output at this last frequency is about 135 amperes, which, since the antenna resistance is about 6 ohms at 7,400 meters wave length, represents about 110 kw. in the aerial to which the alternator is directly connected through an inductance. The signalling key is connected to the exciter circuit, and thus does not carry the full power. Arrangements are made to weaken the driving motor field when the load comes on, in order to keep the speed constant. The aerial is supported by a lattice steel tower with insulated base 825 ft. in height. The receiving apparatus includes a "tone wheel," or motor-driven high-frequency interrupter, which has the effect of producing a musical note in the telephone with a pitch equal to the difference of the received oscillation frequency and the contact frequency. The receiving arrangement is very simple, and the receiving circuit, inductively coupled to the aerial, contains nothing but the necessary inductances and condensers, the tone wheel, and the telephone, no crystal or other detector, nor source of current being required. At Eilvese, signals from Tuckerton have been recorded photographically by a string galvanometer, even by daylight.

The German named Harold Foohtenberger, *alias* Falconer, who, as mentioned in our last issue, had been handed over to the military authorities for having in his possession a complete wireless telegraph apparatus at his home at Thorpe Bay, appeared before a Court Martial at the Royal Artillery Barracks on Wednesday. The prisoner pleaded guilty, his Counsel stating that neither himself nor the prisoner knew until that day of an addition made on Oct. 16th to the Defence of the Realm Act to the effect that no person may, without the written permission of the Postmaster-General, "buy, sell, or have in his possession under his control, any apparatus for the transmission of messages by wireless telegraphy or any component parts." The evidence was that the prisoner had a wireless telegraph apparatus in his room at Thorpe Bay all ready to be assembled, whilst at Whiteley's there were four cases of wireless telegraph apparatus bearing the prisoner's name. It was stated, however, that the latter had been stored at Whiteley's for more than a year. It was submitted that nothing more than a technical offence had been committed. The prosecution emphasised the fact that the apparatus at Thorpe Bay could have been put together at any moment, and it was not disputed that this apparatus and a flash lamp, which was also found there, would have enabled communication with persons three or four miles at sea. The decision of the Court will be made known in due course.

## ELECTRIC TRACTION NOTES

Dr. H. F. Parshall read a Paper last Tuesday before the Institution of Civil Engineers on "The Economics of Electric Railway Distribution," in which he went into considerable detail on the effect of sub-station proportions and spacing. A number of typical cases were investigated, and it was found that with given energy-consumption per unit of length of line the capacity of the sub-stations increases directly with the distance between them. The energy-loss in distribution conductors of a given section varies with the cube of the distance between sub-stations. The cost of attendance is almost independent of the size of the sub-station. The cost of the plant per kw. falls off with the size of the units, but the maintenance and renewals per kw. are more or less constant. With rotary-converter 600-volt sub-stations, and for certain assumed average conditions, the most economical sub-station spacings are  $8\frac{1}{2}$ ,  $5\frac{1}{2}$ , and  $3\frac{1}{2}$  miles for train services of 6, 12, and 24 trains per hour respectively. For 1,200 volts the sub-station spacings are 11,  $7\frac{1}{2}$ , and 5 miles respectively, while when 2,400 volts is adopted the most economical sub-station spacings are 16, 12, and  $8\frac{1}{2}$  miles respectively. Between 600 and 1,200 there is a saving of 14 per cent. in the total annual costs of the distribution system; as between 1,200 and 2,400 volts there is a further saving of 7 per cent., or 21 per cent. as between 600 and 2,400 volts. If the working voltage is further increased to 3,600 volts, there is a decrease in total annual expenditure on sub-station and overhead conductor equipment of only 3 per cent., which will be less than the additional cost of the rolling stock. For single-phase distribution at 5,000 volts the most economical sub-station spacings are 31, 24, and 16 miles for train services of two, three, and six trains per hour respectively. At 10,000 volts single-phase, the most economical sub-station spacings are 45, 34, and 26 miles for the same three train services respectively. With three-phase distribution at 5,000 volts the most economical distances between sub-stations are 88, 31, and 18 miles for the same respective train services. In most of these last cases, however, the economical distance between substations thus determined is greater than would be permissible in practice from considerations of both traffic operation and voltage drop. Further, in the case of single-phase operation, the lower pressure of 5,000 volts is found to be the most economical for certain services, and the higher pressures of 10,000, 12,000, and 15,000 volts in vogue on the continent are explained by considerations of voltage drop.

The Highways Committee of the L.C.C. contemplates increasing its number of tramcar services, and in order to do so it is necessary to arrange for a supply of electrical energy from an outside source. An arrangement has been come to with the London Electric Supply Corporation for an additional supply up to 1,500 kw. at £3 per kw. per annum plus 0.4d. per unit. The price previously paid for a similar supply was £3 and 0.35d., but the increase is due to the extra cost of coal. The power will be transmitted through the Lewisham sub-station.

At the last meeting of the London County Council, it was decided not to proceed with seven of the proposed tramway linking-up schemes on account of opposition by the local authorities. The reason for this decision was the inadvisability of placing contentious proposals before Parliament at the present time.

In order to work the extensions of the electrically-equipped sections of the Italian State Railways now under construction, thirty-four new 3,000-volt three-phase 16 $\frac{2}{3}$ -cycle locomotives have been ordered by the Government—eighteen of the 4-6-4 type, weighing 84 tons, from Brown Boveri & Cie, and sixteen of the 2-6-2 type, weighing 68 tons, from the Italian Westinghouse Co. Both are driven by side-rods from two motors, jack-shafts at the ends being employed in the former, but not in the latter. The motors develop 1,300 h.p. each at 75 kw. per hour. By a combined arrangement of pole changing and cascade connection four economical speeds are obtained, giving 37 $\frac{1}{2}$ , 50, 75, and 100 kw. per hour respectively.

"Telephone Cables." By J. C. Slippy, of Pittsburg. 147 pp. 7 in. by 4 $\frac{1}{2}$  in. 97 figures. \$2.50. This small volume constitutes a useful epitome of American practice with regard to the specification and lay-out of the cable part of the telephone network, particularly overhead work. THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., holds a small stock of this book, and will be pleased to supply copies at 10s. 6d. net each.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published Nov. 12th, 1914

A full list of those of electrical interest among these was published in our last issue. The following are abstracts of some of the more important specifications

Names in italics indicate communicators of inventions from abroad.

20,798/13. **Wireless Synchroniser.** M. P. OTTO (Paris). An apparatus for assuring, by means of waves transmitted from a distance, the continuous movement of two rotating bodies so long as synchronism exists. At the receiving station there is a retarding device periodically actuated by the current transmitted when the moving contact passes through the "zero." The retardation by the receiving station is rendered possible only if there is an absence of synchronism at the time that the moving transmitter and the moving receiver pass the zero. The synchronising current thus only acts periodically and during the passage through the zero position. No engagement takes place at the receiving station so long as there is synchronism. (One figure.)

21,212/13. **Wireless Control of Torpedoes.** M. P. OTTO. The system described above is here applied to the steering and control of marine or aerial torpedoes. (Two figures.)

23,342/13. **High-tension Terminals.** F. COATES and A. REYROLLE & Co. These terminals are surrounded by an earthed metal sheath, and interposed between the terminal itself and the outer sheath are alternate layers of conducting and dielectric material, acting as a condenser to render the potential gradient as regular as possible. (Two figures.)

27,660/13. **Protective Systems.** H. W. CLOTHIER and A. REYROLLE & Co. Improvements in protective systems employing split conductors, in which differential devices are used to control switches on the parallel conductors in pairs, one device acting as a relay to the other. (Three figures.)

28,415/13. **Electrical Treatment of Birds and Animals.** T. THORNE BAKER. Apparatus for producing high potentials for the treatment of birds and animals, comprising an induction coil having one of its secondary terminals connected to earth and the other to a spark-gap, the other terminal of which is in turn adjustably connected to a resonator or tuning coil. One end of the tuning coil is connected to a helix surrounding the enclosure in which the subjects to be treated are placed. (One figure.)

2,499/14. **Sparkign Plug.** C. SPADA (Milan). The central insulated electrode can be screwed in to bring it into rubbing contact with the other for cleaning while the engine is running by turning the head of the plug. When the head is released a spring returns the electrode to its proper sparking position. (Four figures.)

3,218/14. **Semi-Indirect Lighting.** E. C. MCKINNIE (National X-Ray Reflector Co.). Indirect lighting fittings in which the lower portion of the reflector is cut away so that a certain amount of light can pass out through a diffuser and illuminate the translucent external bowl. A table lamp on a similar principle is also described. (Two figures.)

## Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Dynamos, Motors and Transformers:** A. G. BROWN, BOVERI ET CIE [Rotary converters] 24,305/13; THOMPSON (Aktiebolaget Ljungströms Angturbin) [Field magnets] 28,967/13; BROOKS and HOLT [Combined engine starter and lighting dynamo] 29,361/13 B.T.-H. Co. and HUTT [Dynamos] 5,234/14.

**Heating and Cooking:** SIMPLEX CONDUITS, LTD., and WATERHOUSE [Radiators] 19,971/13.

**Ignition:** GUINNESS [Sparkign plugs] 24,165/13.

**Incandescent Lamps:** COLD LIGHT (DUSSAUD PROCESSES), LTD., and HALES [Lighting apparatus] 28,025/13.

**Instruments and Meters:** LAWSON [Mercury motor meters] 5,047/14.

**Storage Batteries:** LINGARD [Recharging] 7,717/14.

**Switchgear, Fuses and Fittings:** HOLT and SMITH [Circuit breakers] 24,593/13; BERRY and MARKHAM [Switches] 25,818/13; CRAWFORD [Circuit breakers] 26,006/13; KREIDLER [Lamp-holders] 2,079/14; MCKINNIE [Illuminating devices] 2,529/14; HOLT and SMITH [Circuit breakers] 19,700/14.

**Telephony and Telegraphy:** WESTERN ELECTRIC Co. (Woodward W.E. Co., U.S.A.) [Exchange systems] 24,927/13; BERGLANDER [Automatic selectors] 4,819/14; HEYS (General Acoustic Co.) [Junction boards] 17,356/14.

**Traction:** BOURN [Prevention of clogging of sand pipes] 29,457/13.

**Miscellaneous:** CROSBEE, CROSBEE, and ROGERS [Electric horns] 25,796/13; FAIRBROTHER (Thermo Electric Instrument Co.) [Controlling devices] 1,779/14; DEAN [Electric horns] 5,347/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Meters:** H. ARON-ELECTRIZITÄTSZÄHLERFABRIK GES. [Prepayment] 10,417/14.

**Telephony:** SMITH [Telephone systems] 21,338/14.

The following Amended Specifications can now be obtained:—

R. F. CAREY and R. WAYGOOD & Co. [Vacuum cleaner control] 26,660/12.

AUTOMATIC TELEPHONE MANUFACTURING Co. [Party line telephones] 29,359/12.

## Applications for Suspension of Patents

12,724/10. **Welding.** H. L. J. SIEMUND (New York). An application for suspension of this patent made by J. Roberts will be heard on Nov. 23rd. The specification describes a method of electric welding, repairing or patching, in which an arc is struck between a stick of the material to be added and the work.

12,871/13. **Electric Ignition.** W. RUTHARDT (Stuttgart). In the application by C. A. Vandervell & Co. (see ELECTRICAL ENGINEERING, Oct. 1st, page 529) it has been decided that a licence be granted.

## Opposition to Grant of Patents

Opposition has been entered to a grant on the following application:—

21,029/13. **Metal Filament Lamps.** C. O. BASTIAN. Lamps with wire filaments in helical form, with the convolutions arranged at a distance from one another equal to or less than one-half the diameter of the wire.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

21,216/00. **Graphitising.** P. M. JUSTICE (International Acheson Graphite Co., U.S.A.). A method of graphitising electrodes and other carbon articles by subjecting them to a sufficiently high temperature for a sufficient time, by passing current through them while arranged in rows in contact, with their largest dimensions at right angles to the direction of flow of the current while embedded in a poorly conducting material.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** J. LAFITTE [Arc lamp with revolving reflectors] 15,746/08.

**Electrochemistry:** R. H. F. FINLAY [Anodes for electrolysis] 17,492/07.

**Switchgear:** P. KENNEDY [Switches] 16,962/02.

**Miscellaneous:** G. H. ROWE [Electromagnetic cushioning device] 15,874/08.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**"TUBOLITE."**—A list from the Edison & Swan United Electric Light Co., Ltd. (123 and 125 Queen Victoria Street, E.C.), and Ponders End, Middlesex, deals with lamps, reflectors, &c., for the well-known "Tubolite" system of strip lighting, both with metal filament and carbon lamps.

**STORAGE BATTERIES.**—Another list from the Edison & Swan Co. deals with Ediswan accumulators in all sizes from ignition to central station calls, and including several special patterns for particular purposes.

**CONVEYORS, &c.**—We have received from E. A. Reed & Co., Ltd. (14 Victoria Street, S.W.), a new catalogue dealing with various forms of elevating and conveying machinery, pumps, valves, and other appliances, as well as particulars of general structural steelwork, &c.

**ALUMINIUM.**—The British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), has issued a revised edition of their pamphlet on the employment of aluminium for electric power transmission. The matter has been brought in line with the regulations existing in various countries, and among other additions we find a table of safe currents for overhead aluminium conductors, on a basis of temperature rise, and information regarding line regulation, erection, scrap value, &c. The progress in power transmission by means of aluminium since the last issue of this pamphlet has been remarkable, and one of the most noticeable instances is the Big Creek line, which delivers power at 150,000 volts some 241 miles from its source. Upon this line no less than 2,678 tons of aluminium strand was employed.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**RADIATORS.**—A very attractive little folder with an artistic winter scene reproduced on the cover, and entitled "Kill the Chill," which is being circulated by the British Westinghouse Electric & Manufacturing Co. (Supply Dept., Long Millgate, Manchester), calls attention to the company's lamp radiators and converters by the aid of effective coloured illustrations.

**HEATING APPARATUS.**—An immersion heater, known as "El Boilo," a breakfast griller, a stove, and a toaster, rejoicing in equally euphonious names, together with a hot point electric iron are listed in a folder from Haycock & Haslett (63, Queen Victoria Street, E.C.).

**FIELD REGULATORS.**—A leaflet from the Electrical Apparatus Co., Ltd. (Vauxhall Works, South Lambeth Road) gives prices and particulars of a complete range of field regulating rheostats from 0.15 to 100 amperes, 1.2 to 3,500 ohms.

**POCKET LAMPS.**—A large number of designs of pocket electric lamps, batteries, and electrical and other novelties are listed in a catalogue from Millard Brothers, Ltd. (123 Houndsditch, E.C.).

### THE ELECTRICAL IRONMONGER

AS mentioned in our last issue, Mr. W. E. Milns, Commercial and Consumers' Engineer of the Birmingham Corporation Electric Supply Department, read a Paper on "The Electrical Ironmonger" before the Birmingham branch of the Ironmongers' Federated Association. After referring to the progress in electric lighting, heating, and power during the last ten years, and welcoming the fact that the unscientific plain opal reflectors and enamelled iron shades were scarce in this country owing to the war, he referred to the relationship between the ironmonger and the electrical trade. The ironmonger, he said, is usually imagined to be master of a large number of trades, and to possess a good knowledge of the various systems of lighting, with the exception of electric lighting. He is also conversant with the many types of coal and gas fires and cooking ranges, and does a large trade in the sale of utensils for the latter, but his knowledge of electric cooking and heating is limited. The time had arrived, Mr. Milns said, for the ironmonger to associate himself more closely with the electrical trade, or rather to satisfy himself whether he was to become an opponent or an ally, instead of remaining practically neutral as hitherto. In his own opinion the ironmonger had not been actually

prejudiced against electrical development, but had simply been unconvinced that electric lighting, heating, and power had reached such a stage as to require his serious notice.

He did not suggest that the ironmonger should design schemes for electric lighting, heating, and power in competition with the wiring contractor unless he was prepared to establish a special electrical department and to keep a qualified staff of wiremen for such work. It was plain, however, that the ironmonger was in close touch with the owner or tenant, and had excellent opportunities for obtaining orders for electric lighting, &c., and he suggested that in most cases these should be sub-let to a wiring contractor, as wiring contractors as a rule bought a considerable amount of ironmongery, and the two trades might mutually assist one another. He warned his audience, however, that they could not be too careful in selecting a contractor of good standing. By this means the ironmonger could deal with all the electrical work in a house, and he saw no reason why he should not also supply fittings and lamps, provided satisfactory arrangements were made with the wiring contractor for wiring and fixing these. A display of electrical fittings in his showroom and the holding of a stock of electric lamps as well as a good supply of electrical catalogues, would be necessary. Only up-to-date fittings should be stocked, and they should not be too crowded, and should be wired so that they could be seen with light on. Electric cookers should be backed up by a substantial maker's guarantee, electric kettles would find a ready sale during autumn and winter, and a profitable business could be done in hiring or hire-purchase of certain makes of heaters. These could be purchased now for a little over a sovereign, carrying with them a three years' guarantee from the makers. They could be let on hire for 2s. per quarter, or on hire-purchase terms for 8s. 6d.

### ELECTRIC FIRE PUMP AT ST. PAUL'S

THE fire protection scheme formerly relied on at St. Paul's included hydrants at the roof levels supplied from rain-water collecting tanks on the stone gallery, but on account of the great weight of these tanks when full, their removal was recently decided upon, and an alternative means for the water supply of these hydrants was required. For

ELECTRICALLY DRIVEN FIRE PUMP.

this purpose, Merryweather & Sons (Greenwich) have supplied one of their "Hatfield" pumps, driven by an electric motor, and fixed at the 60 ft. level. The set, which is illustrated here, is very compact, as the pump and motor are mounted on the same bedplate. The power is transmitted from the

motor to the pump through silent chain gearing, and so smooth running is this, and so quietly does the treble-barrel "Hatfield" perform its work, that the installation is practically noiseless when at work. The pump takes its water from the Water Board's supply, and delivers into the ring main round the drum of the dome under the colonnade, hydrants being fitted on this main at various points. Each of the hydrants is equipped with hose and fittings, and a special feature of the installation lies in the fact that the pump starts automatically as soon as one of the hydrants is opened, so that a fire can be immediately attacked at the roof level without its being necessary to go near the pump. When the hydrant is closed the electric current is automatically cut off, and the pump ceases to work.

### LARGE ALTERNATOR FIELD REGULATORS

FOR the regulation of the main exciting current of large generators two forms of regulator are in vogue, the first frequently known as the rectangular type, and the second the face-plate or circular type. The choice between these two patterns is a question largely of local conditions. The General Electric Co. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.) construct both patterns, of which they have recently brought out some new designs. The illustration shows the latest form of G.E.C. rectangular type regulator. In this regulator the resistance is composed of resistance strip, though when the characteristics of the generator permit "unit" type wire-resistances are employed. The difficulties incidental to the expansion and contraction of the strip are overcome by the strong construction of

"WITTON" MAIN REGULATOR FOR 5,000-KW. TURBO-ALTERNATOR.

framework. To take the stresses due to this cause, the framework is built up of mild channel steel, braced and supported at every point where the stresses are likely to be particularly heavy. A further source of trouble which has been experienced has been the sag of the strip, and means have to be provided for adjusting the strip tension. In these regulators individual adjustment is provided for each turn of the strip, instead of only one adjustment for the whole length. In view of the heavy current to be carried, special care has been given to the design of the contact brushes which are self-aligning, and two sets of screws are provided by which the pressure and the position of the brushes can be adjusted independently. The illustration shows a regulator for a 5,000-kw. Witton turbo-alternator.

### NEW LAMPS AND OLD

THE two illustrations reproduced here, which have been sent us by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), are striking evidence of the progress attained in the efficiency of incandescent lamps. Edison's original lamp, with its carbonised paper filament, produced after many months of experimenting

35 years ago, gave 16 c.p. for 100 watts, whereas the direct descendant, the "half-watt" lamp of to-day, gives 200 c.p.

ORIGINAL EDISON LAMP,  
16 C.P., 100 WATTS.

MODERN HALF-WATT LAMP,  
200 C.P., 100 WATTS.

for the same expenditure of energy, and is thus  $12\frac{1}{2}$  times more efficient.

### A NEW ELECTRIC STOVE

ENCOURAGED by the success of their well-known 125-watt "Pygmy" heater, the London Electrical Trading Co., Ltd. (185 Wardour Street, W.), has produced a new pattern of larger capacity, known as the "Pyro-ring," which will do all that the Pygmy heater will do, but do it four times as rapidly. The appliance is illustrated here, and is

"THE PYRO-RING."

6 $\frac{1}{2}$  in. in diameter. The body is of cast aluminium. Three degrees of heat are provided for, and the handles and legs are designed to keep as cool as possible. The loading is 500 watts, and a pint of water can be boiled in about ten minutes. Another larger 2-kw. stove takes the form of a square hob-plate with a well in the centre containing a grid, under which the heating elements are placed.

### NEW PUBLICATIONS

The following new books and new editions have been published since last March.

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Laboratory Manual. Direct and Alternating Current." By C. E. Clewell. 100 pp. 9 $\frac{1}{4}$  in. by 6 in. 27 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 4s. 6d. net; abroad, 4s. 10d.

"Electric Car Maintenance," by W. Jackson. 275 pp. 9 $\frac{1}{4}$  in. by 6 $\frac{1}{4}$  in. 320 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

"Elementary Magnetism and Electricity," by C. M. Jansky. 212 pp. 9 $\frac{1}{4}$  in. by 6 $\frac{1}{4}$  in. 121 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 6s. 3d. net.

"Continuous and Alternating-Current Machinery," by J. H. Morecroft. 466 pp. 7 $\frac{1}{4}$  in. by 5 $\frac{1}{4}$  in. 288 figures.

(New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 7s. 6d. net; abroad, 8s. 1d.

"Telegraphy," by the late Sir W. H. Preece, K.C.B., F.R.S., and Sir J. Sivewright, K.C.M.G. Revised and partly re-written by W. L. Preece. 422 pp. 8½ in. by 5½ in. 269 figures. London: Longmans, Green & Co.) 7s. 6d. net; abroad, 8s. 2d.

"Electric Wiremen's Work," by J. H. Havelock. 332 pp. 7½ in. by 5 in. 100 figures. (London: Crosby, Lockwood & Son.) 5s. net; abroad, 5s. 6d.

"Electric Light Accounts and their Significance," by H. M. Edwards. 172 pp. 7½ in. by 5 in. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 8s. 4d. net.

"Electrical Engineering. A First-Year Course." By F. Shaw. 147 pp. 8½ in. by 5½ in. 80 figures. (London: George Routledge & Sons, Ltd.) 2s. net; by post, 2s. 3d.

"Electrical Practice in Collieries," by D. Burns. 353 pp. 7½ in. by 5½ in. 172 figures. (London: Charles Griffin & Co., Ltd.) 4th edition. 7s. 6d. net; abroad, 8s. 2d.

"High Power Gas Engines," by H. Dubbel. Translated, edited, and expanded by F. Weinreb. 206 pp. 11 in. by 7½ in. 423 figures and 13 plates. (London: Constable & Co., Ltd.) 18s. net; abroad, 19s.

"Electric Traction," by L. Calisch. 116 pp. 8 in. by 5½ in. 36 figures. (London: Locomotive Publishing Co., Ltd.) 2s. net; by post, 2s. 3d.

"Brown's Marine Electrician for Sea-Going Engineers," by A. E. Larkman and A. H. Larkman. 244 pp. 7½ in. by 5 in. 179 figures. (Glasgow: James Brown & Son.) 5s. net; abroad, 5s. 4d.

"Text-Book on Wireless Telegraphy," by R. Stanley. 344 pp. 9 in. by 5½ in. 201 figures. (London: Longmans, Green & Co.) 7s. 6d. net; abroad, 8s. 2d.

"The Electrical Conductivity and Ionisation Constants of Organic Compounds," by H. Scudder. 568 pp. 9½ in. by 6½ in. (London: Constable & Co., Ltd.) 12s. 6d. net; abroad, 13s. 4d.

"The Electron Theory of Matter," by O. W. Richardson. 612 pp. 8½ in. by 5½ in. 58 figures. (Cambridge: The University Press.) 18s. net; abroad, 18s. 9d.

"A School Electricity," by C. J. L. Wagstaff. 250 pp. 9 in. by 5½ in. 181 figures. (Cambridge: The University Press.) 5s. net; abroad, 5s. 5d.

"Electric Light Fitting," by S. C. Batstone. 317 pp. 7½ in. by 5 in. 238 figures. (London: Whittaker & Co.) 5s. net; by post, 5s. 4d.

"Polyphase Currents," by A. Still. 300 pp. 7½ in. by 5 in. 101 figures. (London: Whittaker & Co.) Second edition. 6s. net; abroad, 6s. 5d.

"Electric Cooking, Heating, Cleaning, &c." A Manual of Electricity in the Service of the Home. By "Housewife" (Maud Lancaster). Edited by E. W. Lancaster. 338 pp. 8½ in. by 5½ in. About 320 figures. (Constable & Co., Ltd.) 3s. 6d. net; by post, 3s. 10d.; abroad, 4s. 1d.

"Principles of Electrical Measurements," by A. W. Smith. 243 pp. 7½ in. by 5 in. 99 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 8s. 4d. net.

"Drawing for Electrical Engineers," by G. W. Worrall. 92 pp. 8½ in. by 5½ in. 70 figures. (London: George Routledge & Sons, Ltd.) 2s. net; by post, 2s. 3d.

The "Mechanical World" Pocket Diary and Year-Book for 1915. 439 pp. 6½ in. by 4 in. 81 figures. (Manchester: Emmott & Co., Ltd.) 6d. net; by post, 8½d.

"The Arithmetic of Electrical Measurements," by W. R. P. Hobbs. Revised and edited by A. R. Palmer. 120 pp. 7½ in. by 4½ in. 20 figures. (London: Thomas Murby & Co.) Sixteenth edition. 1s; by post, 1s. 2d.

"Electric Bells, Alarms, and Signalling Systems," by H. G. White. 84 pp. 7 in. by 4½ in. 57 figures. (London: S. Rentell & Co., Ltd.) 1s. 6d. net; by post, 1s. 8d.

"Electric Mine Signalling Installations," by G. W. Lummis Paterson. 196 pp. 7½ in. by 5 in. 139 figures. (London: Constable & Co., Ltd.) 4s. 6d. net; abroad, 4s. 10d.

"Dynamo and Motor Building," by A. H. Avery. 152 pp. 7 in. by 5 in. 145 figures. (London: Cassell & Co., Ltd.) 1s. net; by post, 1s. 1½d.

"A Manual of the High-Speed Steam Engine," by H. K. Pratt. 270 pp. 8½ in. by 5½ in. 182 figures. (London: Constable & Co., Ltd.) 5s. net; abroad, 5s. 6d.

"The Effect of the War on Commercial Engagements," by F. Gore-Browne. 103 pp. 8½ in. by 5½ in. (London: Jordan & Sons, Ltd.) 2s. 6d. net; by post, 2s. 9d.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Atherton.**—Three transformers and 300 yds. of cable are required.

**Barnet.**—The Barnet Guardians require an electric generating plant and electric lift. Architects, Williams and Cox, 34 Henrietta Street, Covent Garden, W.C. Dec. 7th.

**Keighley.**—Sanction has been received to the borrowing of £17,700 for electrical purposes.

**London: Bethnal Green.**—High- and low-tension cable, static transformers, and sub-station switchgear. Consulting Engineer, H. W. Couzens, 50 Queen Anne's Gate, S.W. Dec. 2nd. (See advertisement on another page.)

**Rawtenstall.**—A Local Government Board inquiry has been held concerning a loan of £6,500 for electrical extensions.

**Rhymney.**—The Council is considering entering into an arrangement with the Rhymney Iron Co. for a supply of electrical energy.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Ayr.**—Kilmarnock Equitable Co-operative Society building (£5,000).

**Blyth.**—New town hall.

**Carlisle.**—Technical school.

**Chelmsford.**—Extensions to isolation hospital (£1,000).

**London: Islington.**—The electric lighting of the Guardians' premises is to be again considered.

**Long Eaton.**—School in Nottingham Road.

**Luton.**—Extensions to isolation hospital (£5,000).

**Manchester.**—Block of offices, Grosvenor Street. Architect, J. B. Thornley.

**Northwich.**—School. Architect, A. E. Powles.

### Miscellaneous

**Australia.**—The time for tendering for various telegraph and measuring instruments has been extended by the Sydney Deputy Postmaster-General until Dec. 9th. Copies of the specifications may be seen at 72 Victoria Street, S.W., or 78 Basinghall Street, E.C., but this information is only of use to firms with resident agents who can be cabled.

**Warrington.**—The Cheshire Lines Committee requires a twelve months' supply of telegraph materials and carbons. Secretary, Battersby Lane.

## TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

The Mirrlees Watson Co., Ltd., has recently received orders for condensing plant from, among others, the Manchester, Devonport, Gravesend, and Leeds Corporations, the Hampstead and Dartford Councils, and the China Light & Power Co.

## APPOINTMENTS AND PERSONAL NOTES

An electrical engineer and tramway manager is required at Erith. Salary from £250 to £400 per annum. Applications to Clerk by the 27th inst.

The salary of Mr. H. C. Busbridge, Borough Electrical Engineer at Swinton and Pendlebury, is to be increased to £200 per annum.

The late Mr. F. Smith, a Director of the London Electric Wire Co. and Smiths, Ltd., left estate valued at £128,279, of which £121,906 is net personalty.

Mr. Alderman John Fettes, the New St. Marylebone Mayor, was at one time Chairman of the Electric Supply Committee.

Particulars of a number of vacancies for shift engineers, &c., are given in our advertisement columns.

## LOCAL NOTES

**Belfast: The Extension Scheme.**—It is not without interest to give briefly the history of the extension scheme concerning which we published a note on p. 582 of our issue for Nov. 5th. We there gave the terms of a resolution postponing the erection of a new power station and authorising extensions at the existing works. This matter was first taken into consideration as far back as June, 1911, when the City Electrical Engineer (Mr. T. W. Bloxam) and Mr. S. L. Pearce, City Electrical Engineer, Manchester, advised the erection of a new three-phase power station to supplement the present three-wire direct-current plant. Both reports particularly advised against replacing the existing D.C. plant as compared with installing A.C. plant on a new site. The matter remained in abeyance until Feb., 1913, when the City Electrical Engineer again reported with additional evidence. Three months later, Mr. Bloxam reported as to the relative cost of a station constructed on six different sites, and showed that the proposed one on the Harbour was the best. Nothing tangible was done, however, until August, 1914, when, as already pointed out, Sir John Snell and Mr. W. J. Pratten reported on similar lines to the previous reports, viz., in favour of a new three-phase station on the Harbour site utilising part of the present station as a rotary-converter sub-station. Notwithstanding this, the Council has now resolved, contrary to all experts, to recommend extensions at the existing works to meet the requirements of the next three years at an estimated cost of £25,000.

**Bristol: Bulk Supply.**—Arrangements have been completed provisionally with the Clevedon, Portishead and District Electric Supply Co. for a supply of electricity in bulk. The consent of the Board of Trade has yet to be obtained, but there should be little difficulty in this. The terms of the contract have been approved by the Council.

**Leeds: The Rateable Value System.**—The Corporation has sanctioned an important modification in the terms of supply for private houses. These consumers will in future have the option of paying on the existing flat-rate basis of 3½d. per unit for lighting and 1d. for cooking and heating purposes, or upon the basis of the rateable value system at the rate of 10 per cent. per annum on the net rateable value of the premises plus ½d. per unit. The object of this new tariff, of course, is to obviate the necessity for two meters and two sets of wires where a consumer desires to use electricity for purposes other than lighting.

**Long Eaton: The Tariff Question.**—The Council has decided not to appeal to the House of Lords against the judgment of Mr. Justice Sargant, confirmed by the Court of Appeal, that the circular offering preferential terms to consumers using electricity exclusively is illegal.

**Willesden: Electric Cooking.**—It has been decided to instal electric cooking apparatus, for which current will be supplied at 1d. per unit, in some of the Council schools for the training of students.

**Wolverhampton: Supply in Bushbury.**—The Corporation has acquired the rights of the Midland Electric Corporation for Power Distribution, Ltd., to supply in the Bushbury district, for a sum of £500.

**Aluminium.**—Some notes on the employment of aluminium for electrical conductors were given by Mr. H. N. Monro at a recent meeting of the Junior Institution of Engineers. Overhead aluminium transmission lines showed a saving over equivalent copper lines of as much as 10-25 per cent., depending on the size and nature of the system. Among the aluminium lines erected in this country were:—three-phase H.T. lines from Aldershot to Enshott, and from Tidworth to Bulford, both for the War Office; lines for Weardale Steel, Iron & Coal Company; Ebbw Vale Steel, Iron & Coal Co.; North Wales Power & Traction Co.; and the Fife Coal Co. For insulated cables aluminium was extensively used, particularly on the Continent, where some hundreds of miles of aluminium mains, principally paper head covered, were laid. For very small cables and heavily armoured cables, aluminium might not show up to the same advantage as for ordinary sized cables, but even in these two classes aluminium cables could effect a saving of 5 per cent. and upwards, depending on the design of the cable. The joining of aluminium cable was a difficult problem in the earlier days. Provided, however, that the joints were carefully made and all moisture excluded, they could be easily and effectively jointed by the very effective mechanical clamps now available. The uses of aluminium for magnet coils, bus-bars, and battery connections were also described.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £55 5s. to £55 10s. (Last week, £52 10s. to £53.)

**Agency.**—Mr. J. H. Baldwin (88 Wallasey Avenue, Belfast) is now acting as Irish representative of Simplex Conduits, Ltd.

**Companies Struck off Register.**—The names of the following will be struck off the register of joint stock companies within three months unless cause is shown to the contrary:—British Wireless Telegraph Syndicate, Ltd.; Electrical Fittings Co. (1911), Ltd.; and the National Electric & Motor Corporation, Ltd.

## NEW COMPANIES

**CITY OF FREETOWN (SIERRA LEONE) ELECTRICITY CO.,** 71A Queen Victoria Street, E.C. Capital £15,000 in £5 shares. The first directors are Hugo Hirst, M. J. Railing, L. Gustav Byng, and A. I. S. Baron.

**SMALL ELECTRIC MOTORS,** Phipp Street, Great Eastern Street, E.C. Capital £10,000. To take over the business of F. W. Potter & Co. at same address.

**"CEAG" MINERS' SUPPLY CO.**—Registered by Jordan & Sons, Chancery Lane, W.C. Capital, £10,000. Dealers in electric and other safety lamps.

**"Things that Happen in Wartime."**—Under this heading, the *Daily Express* has published the following startling announcement:—"Many of the most recently drafted German troops are provided with electric heaters small enough to be carried in the pocket and operated by a dry cell." We are surprised at our contemporary's moderation; why not suggest that the dry cell should at the same time work electric fans and ozonisers for purifying the air in the trenches, electric toasters for rendering the somewhat inferior bread more palatable, electrical excavators for saving the manual work of digging the trenches altogether, and should also be used to charge the barbed wire entanglements at dangerous voltage.

**The Association of Supervising Electricians.**—At a meeting last week a Paper was read by Mr. H. C. E. Jacoby, on A.C. commutator motors. The subject was treated at considerable length, and an interesting discussion followed. The next Paper, on "Wiring Systems," will be read on Tuesday, December 15th, and the inaugural dinner will be held at the London Tavern, Fenchurch Street, on the 28th inst. By the courtesy of the London Electric Railways the members of the Association recently paid a visit to the Paddington-Bakerloo Station to examine the working of the escalators, the whole of the apparatus being thoroughly explained by their inspector, Mr. Lindsay. After leaving the escalators the Company conveyed the members to Edgware Road Station to examine the Ozonair plant.

**The War and Commercial Engagements.**—A useful hand-book on the effect of the war on commercial engagements, including the Acts of Parliament, Rules, and Treasury Orders in connection with the war, by Mr. F. Gore Browne, has just been issued at the price of 2s. 6d. by Jordan & Sons, Ltd. A number of interesting points of law raised by the present situation are discussed, the provision of various Acts which bear on the question, existing before, are summarised, and new proclamations, acts, orders, and regulations promulgated since the opening of hostilities are given in some detail. Among the subjects dealt with are postponement of payments, aliens' restriction, patents, trading with the enemy, contraband of war, &c.

**Electric Vehicles.**—A number of points in connection with electric vehicles were discussed at the recent convention of the Electric Vehicle Association of America, held at Philadelphia. A variety of aspects of the subject were reviewed, and a general impression was gained of closer co-operation between the interests represented in the electric vehicle industry and the increase of charging facilities in America. There was some discussion on the possibility of introducing electric vehicles of very low price, but it did not appear that much progress was being made in that direction. Good experiences were reported in the use of battery traction for fire brigade appliances, in postal service, and for central station purposes, and an interesting technical paper was read by Mr. T. H. Schoeff on regenerative braking, which is not much used in America, bringing forward a system requiring only a few extra contacts on the controller and a separate three-cell exciter battery. Another paper embodied the experiences of a number of industrial firms with electric commercial vehicles.

### SUMMARY

THE running of inverted rotary converters is dealt with in our Questions and Answers columns (p. 608).

AN interesting letter from our Copenhagen correspondent mentions some of the difficulties which the German electrical industry is now meeting. Copper and aluminium have risen almost to famine prices, the cost of rubber and leather goods has doubled in some cases, but the price of lamps has dropped owing to the curtailment of exports. An analysis of the trade with the Allies which has been lost to Germany is given (p. 609).

THE necessary Parliamentary notice has been given of the L.C.C. power scheme. Notices are also given of the proposal to introduce two Bills by a company. The first one would constitute this the operating company, whilst the second would constitute the company the sole authority, but for a very smaller area than in the L.C.C. Bill (p. 609).

A DIVISIONAL Court has held that debts owing to companies registered in this country but having "enemy" shareholders must be paid. An amendment to the "Trading with the Enemy" Act provides that dividends payable to "enemy" shareholders shall be held in trust by the Public Trustee (p. 609).

THE Intermediate-Grade Paper in Lundbergs' Electric-Light Switching Competition is published. Readers are reminded that the value of the prizes given is larger than in the case of the firm's previous competitions (p. 610).

AMONG the subjects of the Patent Specifications published at the Patent Office last week are radiators, rotary converters, and automatic telephones. The

grant of patents relating to tramway brake adjusters and mine signalling is opposed. The patent for conversion from D.C. to A.C. by the Duddell musical arc has expired after a full life of 14 years (p. 611).

NOTES on a new Marconi station and the dislocation of telegraph traffic due to the war are given under "Telephony and Telegraphy" (p. 612).

ARTICLES on shop lighting, emergency oil-driven ship lighting sets, and electric heating and cooking apparatus appear in our Trade Section (p. 612).

A 500 kw. D.C. turbo-generator is required at Winchester; cable at Middlesbrough; meters at Watford; electrical fittings at West Ham; and new plant at Hammersmith (£10,000) (p. 614).

THE St. Pancras Council has authorised the Western Electric Co. to purchase copper on its behalf in advance (p. 614).

REFERENCE was made to the success of the recent advertising campaign at the Edison & Swan Co.'s meeting (p. 614).

**Arrangements for the Week.**—(To-day) Thursday, Nov. 26th. Institution of Electrical Engineers. "Power Plant Testing," by W. M. Selvey. 8 p.m.—Greenock Electrical Society, 21 West Stewart Street. "The Oscillograph," by J. A. Kinnaird.

Monday, Nov. 30th. Institution of Electrical Engineers, Newcastle Section. "Power Plant Testing," by W. M. Selvey. 7.30 p.m.

Tuesday, Dec. 1st. Institution of Electrical Engineers, Manchester Section, at Engineers' Club. "Power Plant Testing," by W. M. Selvey. 7.30 p.m.—Illuminating Engineering Society at Royal Society of Arts. Discussion on "Illuminating Engineering in War time: some Lessons to be learned from the Present Lighting of London."

Wednesday, Dec. 2nd. Institution of Electrical Engineers, Yorkshire Section, at Philosophical Hall. "Power Plant Testing," by W. M. Selvey. 7 p.m.

**The Electric Vehicle Committee.**—At a recent meeting, the committee reconsidered the question of sizes of cable for charging leads, and decided that it would simplify matters if, for the present, the standard charging plugs were made for one size of cable only, having conductors of 0.1 sq. in. section, the earth wire remaining of the section already recommended. The Committee also had before them some suggestions made by the Engineering Standards Committee, and it was decided to revise the specification further. Arrangements were made in regard to the forthcoming Quarterly Journal, and Mr. A. H. Seabrook was appointed hon. editor. He will take over this duty after the issue of the first number, the preparation of which the hon. secretary had undertaken.

**The Association of Supervising Electricians.**—The inaugural dinner will be held at The London Tavern, Fenchurch Street, on Saturday, at 6.30 p.m. The gathering bids fair to be a large one, as the Association already comprises over 70 members. A number of tickets have been taken by manufacturing firms who are necessarily in close touch with the supervisors, and it is hoped that as many members as possible will attend and bring their friends. The president, Mr. A. H. Dykes, has kindly consented to preside at the dinner and take the chair at the concert which will follow. Tickets may be obtained from the Hon. Sec., Mr. C. J. Banister, 14 Pullborough Road, Southfields.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,418.

A small building for storing explosives at a colliery is fitted with two lightning conductors, one at each end of the building. Each conductor terminates in a copper earth-plate, 2 ft. square, packed in coke, and the resistance between the two conductors through the earth was found to be 17 ohms. Is this a satisfactory value?

Discuss the earthing of lightning conductors, and say whether it would be an advantage to connect the two plates together with a copper bond.—"Tyneside."

(Replies must be received not later than first post Thursday, Dec. 3rd.)

### ANSWERS TO No. 1,416.

Discuss the advisability of running "inverted" rotaries in parallel on both D.C. and A.C. bus-bars, (1) in parallel with each other; (2) in parallel with each other and a separate A.C. supply. The rotaries in question are shunt wound, and are fitted with direct-coupled exciters, and each feeds into the A.C. bus-bars through a separate transformer.—"M. S."

The first award (10s.) is made to "POLYPHASE" for the following reply:—

The conditions essential to the successful inverted running of rotary converters are:—(a) a separate exciter; (b) a magnetically weak armature compared with the field; and, if several rotary converters are to be run in parallel, (c) each rotary converter should feed into separate transformers or separate primary windings on the same transformer. As the first and last of these conditions are fulfilled, and presumably the second is also fulfilled, there is no reason to anticipate that the running of the machines in question should be any other than successful. The following is a brief explanation of the circumstances governing the successful operation of inverted rotary converters:—When operated in the orthodox fashion, the rotary converter has its speed governed by the frequency of the A.C. generators, but when running inverted the converter is, as far as the C.C. side is concerned, an ordinary C.C. motor, and the same characteristics which govern the speed of a C.C. motor also govern the speed of the rotary converter. A weakening of the field will increase the speed, and a strengthening of the field will reduce it. Fluctuations in the supply voltage will therefore vary the speed of the converter, but in addition there are other factors which have the effect of causing irregularities in the speed. The main one is variation in power factor of the load. This power factor is, of course, in practice varying from minute to minute, especially when a large number of induction motors are being stopped and started up. The lagging current weakens the field, while leading currents have the opposite effect. Variations in the power factor will mean proportional variations in strength of the armature reactive ampere turns which affect the field strength, and therefore the speed of the converter. An ordinary shunt wound converter running inverted on a varying inductive load would therefore give considerable trouble owing to variations of speed. Precautions against this have therefore to be taken. The problem is to keep the field strength, and therefore the speed, as constant as possible. The two methods usually adopted in practice are:—first, to supply

the rotary converter from a separate exciter; and, secondly, to make the armature magnetically weak as compared with the field. Usually both precautions are taken, and are fully effective. When rotary converters run in parallel inverted they are liable to the same trouble of cross-currents as discussed in Question No. 1,408, Sept. 24th, 1914. These troubles can be eliminated in the same way as for rotary converters running in the orthodox fashion, viz., by means of balancing coils or by supplying them from separate windings. As has been said, all the conditions mentioned for the successful running of rotary converters inverted and in parallel appear to have been complied with in the case mentioned in the question.

The second award (5s.) is made to "A. R. T. C.," who writes as follows:—

The rotary converter is a machine which can run as well one way as the other, although in practice it is necessary to introduce one or two modifications when running D.C.-A.C. which are not necessary when running A.C.-D.C. Considering case (1), it will be necessary to make use of the exciter on each machine for exciting the main field for the purpose of holding the speed, and therefore the frequency constant. If starting is carried out from the D.C. side, the excitation will be taken from the D.C. bars, and after the rotary is in synchronism the excitation will be transferred to the exciter, suitable paralleling gear being provided. As the whole A.C. supply is taken from the rotaries, the frequency depends on the strength of the fields, assuming constant D.C. volts. If the A.C. load is at unity P.F., then there will be practically no armature reaction, and the speed will remain practically constant with change in load. If, however, a load of P.F. less than unity is connected to the rotary, the wattless current will influence the strength of the field. In the case of an induction motor, where the P.F. is lagging, the wattless current would have a demagnetizing effect, and the rotary would increase in speed. It is the function of the exciter to compensate for this variation. The field is supplied from the exciter, which is run with comparatively weak saturation, so that an increase in speed causes a proportionately greater increase in terminal voltage, thus increasing the excitation of the rotary and keeping the speed almost at normal. It is usual, although not necessary, to have a series winding on the rotary in order to assist the exciter, but as the machines in question are shunt wound it is not necessary to go into the question further. We must now consider the effect of a change in the D.C. voltage. If the voltage increases, the rotary begins to speed up, and at once the exciter automatically increases the excitation of the rotary and keeps the speed within limits. In practically all cases the D.C. voltage will not vary more than 3 or 4 per cent. from the mean, and for this variation the exciter will keep the rotary speed within 1 per cent. There is another point to consider, and that is the voltage drop. For the usual 460-500-volt machines the voltage drop will not exceed 2 to 3 per cent. Whether this is sufficiently close depends on circumstances. Where the D.C. voltage is subject to variation and feeder drops have to be considered, it may be advisable to provide rotaries with A.C. boosters, the fields being connected to the D.C. supply. It is possible, also, to provide the booster with series windings to compensate for the drop, or even to enable a compounding effect to be obtained. Regarding case (2), where the rotaries are to run in parallel with an existing A.C. supply, it would not be necessary to use the exciters, as the A.C. generators would fix the frequency. It would be almost necessary to use rotaries with boosters for ease in paralleling, as well as on account of fluctuations in the load which would occur with every change in the D.C. voltage. To damp down these fluctuations, a series winding could be put on the booster and so connected that, as the D.C. voltage increased, the resultant increase in load would, by means of the series coils, tend to keep the A.C. volts, and therefore the output, fairly constant. Of course, if a constant D.C. voltage is available, series coils on the booster would be unnecessary.

Among other replies, considerable merit is shown in those of "L. R.," "Electron," and "E. P. H."

## ANSWERS TO CORRESPONDENTS

**CONSTANT READER.**—We have replied to your queries by letter.

**POSTULATOR.**—You will find a similar question of open delta or  $\nabla$  connection of transformers, relating, however, to auto-transformers, dealt with in the replies to Question No. 1,322, ELECTRICAL ENGINEERING, Jan. 30th, 1913, p. 63. You will probably be able to apply this to your case without difficulty. We may have an opportunity of giving your first question for competitive replies.

"PHONE" wishes to hear sermons preached in church one mile away. The microphone (not "dictaphone") should be of a type suitable for a large current with a large diaphragm and back plate, but in other respects not necessarily differing from standard designs. Several microphones in parallel should be used, and there should be the ordinary induction coil between the microphones and the line. The larger the surfaces and the greater the number of microphones, the better will be the result in the case in which "Phone" wishes to use a loud speaking

receiver instead of one held close to the ear. There are some loud-speaking receivers on the market, but if "Phone" manufactures his own the chief points to observe are the use of a strong permanent magnet, a sensitive diaphragm well clamped, and a properly fixed gramophone trumpet.

A correspondent wishes to know where crystalline selenium can be obtained, and wishes for particulars of thermo-electric couples using bismuth and antimony or their alloys. Perhaps some of our readers can enlighten him.

### GERMAN INDUSTRIAL DIFFICULTIES

OUR Copenhagen correspondent sends us some interesting particulars on matters connected with the electrical industry in Germany. As it is very difficult to import copper and aluminium the German Government has practically commandeered all the stocks of these two metals which German manufacturers hold. It appears, however, that, if a manufacturer gets an order which requires copper or other similar material, the Government allows him to buy back the necessary metal if it considers that the order should be executed. German firms with whom our correspondent has business relations have written him that they at present pay about £85 per ton for electrolytic copper (the price in England is £58 10s.) and for 98 per cent. aluminium about £140 per ton (as against about £87 here). For rubber and rubber goods the German firms are worse off still, and recent German quotations for goods principally made of rubber or ebonite are from 50 to 100 per cent. higher than usual. In leather there is also a scarcity, and leather goods have risen over 100 per cent.

Notwithstanding all this the Germans still export a large quantity of electrical goods, and it is surprising that prices on the whole are not greatly increased. Metal filament lamps are, in fact, being sold in large quantities at prices that are lower than they have ever been before, and our correspondent does not believe that the prices of these will go up just at present. This is no doubt partly because a very large proportion of Germany's electric lamp manufacture has always been hitherto for export, and partly because electric lamps are made by girl labour, so that the output of the factories can very well be in excess of the demand. Lampholders, switches, and other articles in the construction of which copper and brass enters largely have so far only risen from 10 to 15 per cent.

Our correspondent adds that practically all his business connections in Germany continue to send him printed matter in large quantities containing "fairly tales or rather goblin tales" about the crimes England is committing, has committed, and will commit.

It is of interest to note that the *Elektrotechnische Zeitschrift*, the leading German electrical newspaper, only now appears at irregular intervals, about every second week instead of weekly. We have heard nothing of the other two electrical papers, *Kraftbetriebe & Pannen* and the *Elektrotechnischer Anzeiger*, and it is not improbable that these have suspended publication altogether. It is of interest to contrast the position with that in England, where there are six weekly electrical newspapers, all of which are being published as usual.

An article which appeared in the *Elektrotechnische Zeitschrift* of Aug. 27th gives some interesting information as to Germany's previous export trade in electrical machinery and apparatus, supplementing that which we were able to publish in our own journal on Aug. 13th. The latest revised figure for the total of Germany's electrical exports for 1913 is £16,500,000, of which 34½ per cent. was to countries now at war with Germany. This 34½ per cent. was divided among the various countries as follows: Great Britain, 10½ per cent.; Russia, 12 per cent.; Belgium, 6½ per cent.; and France, 5½ per cent.

To England the chief exports were: Dynamos, Motors, Transformers, &c., £243,000; Accumulators, Batteries, &c., £9,000;

Cable, £53,000; Arc Lamps and Projectors, £27,000; Incandescent Lamps, £223,000; Telegraphic and Telephonic Material, £93,500; Instruments and Meters, £73,000; Insulated Wire, £308,000; Carbons, £100,000; Unclassified, £487,000.

To Russia.—Dynamos, Motors, &c., £426,000; Accumulators, Batteries, &c., £4,000; Cable, £31,000; Arc Lamps, &c., £63,000; Incandescent Lamps, £440,000; Telegraphic and Telephonic Material, £104,000; Instruments and Meters, £232,000; Insulated Wire, £44,000; Carbons, £33,000; Unclassified, £486,000.

To Belgium.—Dynamos, Motors, &c., £224,000; Accumulators, Batteries, &c., £10,000; Cable, £212,500; Arc Lamps, &c., £9,000; Incandescent Lamps, £119,000; Telegraphic and Telephonic Material, £55,500; Instruments and Meters, £51,000; Insulated Wire, £86,000; Carbons, £46,000; Unclassified, £233,000.

To France.—Dynamos, Motors, &c., £149,000; Accumulators, Batteries, &c., £3,000; Cable, £10,000; Arc Lamps, &c., £10,000; Incandescent Lamps, £131,000; Telegraphic and Telephonic Material, £36,000; Instruments and Meters, £60,000; Insulated Wire, £15,000; Carbons, £47,000; Unclassified, £380,000.

This trade is now absolutely lost to Germany, and if British firms display sufficient energy, practically the whole of it should be acquired by the conclusion of the war.

### THE FUTURE OF LONDON'S ELECTRICITY SUPPLY

THE necessary Parliamentary notices have been given with regard to the London County Council's power scheme, a general outline of which has been already given in our columns. The proposed Bill sets up the electricity authority for London and adjoining districts, gives power to transfer the various undertakings to the operating company, establishes the Technical Committee, and generally gives the Council all the powers which have been referred to in the special report by Messrs. Merz & McLellan and in a report by the Special Committee of the Council which has been dealing with the matter. It is also proposed to buy land in Barking and Erith for the purposes of generating stations.

In addition, notice is also given of a Bill relating to the incorporation of the proposed operating company. It empowers this company to negotiate for and carry into effect agreements with the London County Council or any public authority authorised to supply electricity in or near London and to act as agents for the London County Council or any such authority.

Apparently with a view to providing an alternative, in the event of the L.C.C. Bill not being passed in its present form, a second Bill, by the same promoters, relates to the incorporation of a company with powers to supply electrical energy for all purposes in an area comprising the County of London and portion of the counties of Middlesex, Hertfordshire, Buckinghamshire, Berkshire, Surrey, Essex, and Kent. This area is considerably smaller than that proposed in the L.C.C. scheme, and leaves out all the important extra metropolitan supply authorities. It includes for the most part the bulk supply area already granted to the Metropolitan Electric Supply Co. in the west of London and a number of districts outside London in which the County of London Co. has power to supply. The Bill will also take powers to transfer to the new company the undertakings of all the London electric supply companies either by agreement or by arbitration.

With regard to the London County Council scheme, the Law and Parliamentary Committee of the Hammersmith Borough Council recommends that authority to urge local authorities and companies supplying electricity in the area proposed to be dealt with in the Bill, to make strong representations to the London County Council to postpone it, at any rate for the 1915 session.

Mr. H. H. Gordon has resigned from the Special Committee on London's Electricity Supply, which has been dealing with the matter on behalf of the L.C.C. This action is not altogether unexpected after Mr. Gordon's uncompromising speech during the debate on the scheme (*ELECTRICAL ENGINEERING*, Nov. 12th, p. 587.)

**London Electrical Engineers (T.F.).**—The Corps of London Electrical Engineers (Territorial Force) is again open to recruiting. Electrical engineers, central station engineers, and engine drivers are specially required. Forms of particulars can be obtained from the Officer Commanding at 46 Regency Street, Westminster, S.W.

## TRADING WITH THE ENEMY

THE position with regard to trading with the enemy has been made somewhat clearer during the week, partly through a judgment of a Divisional Court and partly by an amendment to the Trading with the Enemy Act, 1914. We referred to the general position under the Proclamation issued early in September, in *ELECTRICAL ENGINEERING*, Sept. 17th, p. 502. Limited companies registered in this country are not considered to have "enemy character," even if the shares are held by alien enemies, but the Board of Trade may appoint the Public Trustee to act as custodian in the case of all companies holding money which, but for the conditions of war, would have been payable to shareholders in enemy countries. The Bill also provides that the assignment of debts by enemies is invalid, and any person knowingly paying such a debt will be guilty of the offence of "trading with the enemy." It is also provided that sums due on coupons, suspected of being enemy property, shall be paid into court, and fresh conditions are laid down as to the incorporation of new companies.

The payment of dividends of German shareholders to a trustee appointed by the Government was, as a matter of fact, actually suggested by Mr. Hugo Hirst in the case of the Osram Lamp Works, Ltd., and the suggestion was, we believe, adopted by the Government soon after the commencement of the war.

Another aspect of the "trading with the enemy" question is as to the payment of debts incurred before the war to companies registered in this country, but having a large proportion of their shares held by enemies. This point was brought into prominence in the recent action by the Armorduct Manufacturing Co., Ltd., against Messrs. Defries & Co. (*ELECTRICAL ENGINEERING*, Oct. 22nd, p. 555), when Judge Atherley Jones, in the City of London Court, held that as the shares of the Armorduct Co. were held mainly in Germany, the payment of a debt of 30s. by Messrs. Defries & Co. would constitute "trading with the enemy." A Divisional Court, consisting of Mr. Justice Horridge and Mr. Justice Rowlatt, on Thursday, however, held that this view is wrong, and that a company registered under the Companies Acts in this country, no matter the nationality of its shareholders, is a British company, and could carry on business in this country as if a state of war did not exist. It was argued for Messrs. Defries that a company merely represented its shareholders, that in this case the profits from such debts would go to the enemy, and consequently this would be "trading with the enemy." Messrs. Defries, of course, contested the case as one of principle, and counsel for the Armorduct Co., remarking that the result would inure to their benefit, said it was not proposed to ask for costs.

It was announced in the House of Commons on Monday that an inspector was appointed some time ago under the "Trading with the Enemy" Act in the case of Siemens Brothers & Co. and Siemens Brothers Dynamo Works, Ltd.

## LUNDBERGS' ELECTRIC-LIGHT SWITCHING COMPETITION

(For Initial Announcement, and Particulars of Prizes, etc., see "Electrical Engineering" of Nov. 12th, p. 587.)

### RULES TO BE OBSERVED IN WORKING PAPERS.

1. Three Papers are set: Preliminary, Intermediate and Advanced. Any one of the three papers may be taken, but not more than one. The Preliminary Paper was published in "Electrical Engineering" of Nov. 19th, the Intermediate Paper is given below; and the Advanced Paper will be published on Dec. 3rd.

2. Competitors who have passed the Preliminary Grade on a previous occasion must take either the Intermediate or Advanced Grade. Those who have passed the Intermediate Grade must take the Advanced Grade. Those who have passed the Advanced Grade cannot enter.

3. When figure or page numbers are mentioned in the questions, they refer to the booklet "Lektrik Lighting Connections" (new 3rd Edition \*); by the help of which the paper may be worked.

4. Each answer must be done on a separate sheet (or sheets) of paper, on one side only; and each sheet must bear the writer's full name and address. It is not necessary to paste the questions on the answer paper.

5. Each answer must be numbered to correspond with the question.

6. Any competitor who does not wish his own name to appear in the published results should give a *nom-de-plume* or fancy name for this purpose. In all such cases, however, Rule 4 must be adhered to. In the published results only the names (or *noms-de-plume*) and the towns (not full addresses) of successful candidates will be published.

7. Answers to Papers must be addressed to the Editor of "Electrical Engineering," 203, Temple Chambers, London, E.C. Those

\* For the convenience of our readers we have arranged to keep a stock of this Booklet, and a copy will be sent by return of post on receipt of seven penny stamps. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203, Temple Chambers, London, E.C.

from competitors living in or near the United Kingdom must reach the Offices of "Electrical Engineering" on or before Jan. 11th next, and the results will be published in "Electrical Engineering" of Feb. 25th, 1915. Answer Papers from far-off competitors must reach the Offices of "Electrical Engineering" by June 1st, 1915, and the results will be announced later.

8. The answer papers sent in will not be returned.

### INTERMEDIATE-GRADE PAPER.

As many as possible of the following ten questions should be answered.

1. Explain briefly the differences between the controls in Circuits 36, 81, and 87, and the reasons for same.

2. The hall and staircase lights in a doctor's house have been wired to a two-way-intermediate control. It is desired afterwards to substitute something for one of the end two-way switches which will act in this capacity and at the same time allow an additional light (in the porch) to be plug-connected to it, this light to be unaffected by the switches. What apparatus would you use, and what additional wiring would be necessary?

3. The auditorium of a small picture theatre is lighted by groups of mixed white and red lamps. The red lights are used only while the pictures are running, and the white lights during the intervals. At one switch-point the current can be put on to either the red or white lamps, or it can be turned off. At two other switch-points the light, if already on, can be changed from white to red, or from red to white. Sketch the connections. ("Marvel" switches must not be used, as their current capacity is not great enough).

4. How could the head lamps on an automobile be arranged to give a dim light when passing through towns or when standing still? Sketch two possible arrangements of lamps and switches without introducing any other portions of the car wiring, and say what the advantages of each are.

5. Compare the two methods (Circuits 61 and 62) of connecting to series-parallel-and-off switches, and state what advantages or disadvantages (if any) each possesses.

6. A fairly-large sitting-room with two doors is fitted with Circuit No. 52. The switches are placed at the doors, and by one of these the + and - leads rise through the floor. X consists of six lights, 3 on a counterweight pendant, and three on single-light wall brackets. Y consists of eight picture lights. Make a plan of the room, and show thereon the positions of the lamps, and the run of the wires.

7. In wiring-up two "Marvel" switches for Circuit 41, a wireman, instead of following the regulation method of connecting the strapping wires, connects them 1 to 2, 2 to 3, and 3 to 1. What difference (if any) will this make in the control?

8. Select master controls (one in each case) suitable for: (a) a small shop, (b) an office, (c) a house, (d) some other situation. Show where the various switches would be placed, and explain how the controls would be used.

9. Show that the electric-wire-and-switch system (with modern controls) is as great an advance upon the gas-pipe-and-tap system, as the latter was upon oil-lamps and candles.

10. Criticise the construction of the "Pivot" single-way and two-way, and the "Duplex" two-way-off tumbler switches. Enumerate such good points therein as you can discover for yourself.

N.B.—Samples of any of the switches, &c., referred to can be supplied to competitors at the average rate of 2s. 6d. each. Requests for samples must be accompanied by remittances, and must be sent direct to A. P. Lundberg and Sons, Switch Specialists, 477-489 Liverpool Road, London, N. The money will be returned when the samples are sent back in good condition. Mention Competition when ordering. The above is an outside price as regards most switches, and a considerable reduction can generally be made when competitors desire to retain the switches.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Nov. 19th, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

19,971/13. **Radiators.** SIMPLEX CONDUITS, LTD., and L. N. WATERHOUSE. A design of radiator comprising a conical or parabolic reflector mounted on a universal joint and one or more heating elements in the form of a rod along the axis of the reflector. (Seven figures.) This radiator was described in ELECTRICAL ENGINEERING, Oct. 22nd, p. 554.

24,305/13. **Rotary Converters.** A. G. BROWN, BOVERI ET CIE. Rotary converters with interpolar commutating windings on cores have a permeability about equal to unity even at low loads. (One figure.)

25,818/13. **Switches.** W. H. BERRY and W. J. MARKHAM. An improved design of enclosed push-in switch fuse in which the fuse-carrier forming the movable contact bridge is mounted on a parallel motion consisting of two toggle joints to the elbows of which springs are attached giving the desired quick break action. (Two figures.)

28,025/13. **Projector Lamp.** COLD LIGHT (DUSSAUD PROCESSES), LTD. and G. E. HALES. Details of construction of a projector lamp in which a number of incandescent lamps, mounted on a rotary carrier, are lighted momentarily in succession as they pass across the axis of the optical system. (Two figures.) (See ELECTRICAL ENGINEERING, Vol. IX., p. 262, May 8th, 1913.)

29,361/13. **Engine Starter and Car-lighting Dynamo.** B. BROOKS and W. HOLT. This machine has two armature windings connected to the same commutator, each suitable for a different number of effective poles. An additional brush is put into circuit when the maximum number of poles is energised for running at slow speed for engine starting. (Five figures.)

4,819/14. **Automatic Telephones.** C. A. BETULANDER. A telephone system in which the different circuits are selected by means of combining relays, and a selective device controlling their circuits provided with two or more series of selective relays adapted to receive or mark the selective current impulses corresponding to the various digits. (Two figures.) See ELECTRICAL ENGINEERING, July 9th, p. 399.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Dynamos, Motors, and Transformers:** A. G. BROWN BOVERI ET CIE. [Rotary converters] 24,337/13; LUCAS AND TURNER [Engine starter] 1,227/14; HADDAN [Motors for D.C. and A.C.] 4,249/14.

**Electrometallurgy and Electrochemistry:** ROSSI [Electrodes for nitric oxide preparation] 23,959/13; MACHALSKI [Electric furnaces] 15,455/13.

**Heating and Cooking:** DOWNE and BROMITON & KENSINGTON ACCESSORIES CO. [Cooking apparatus] 23,218/13; NEWITT & FLETCHER [Soldering irons] 25,621/13.

**Incandescent Lamps:** BASTIAN [Filaments] 22,331/13.

**Switchgear, Fuses, and Fittings:** HOPE [Switches] 24,198/13; ROOTHAN and FERRANTI, LTD. [Quick break switches] 24,672/13; POWELL [Earthing and binding clip] 25,335/13; BROADBENT [Conduit fittings] 25,544/13; BONNELLA and BONNELLA [Switches] 27,870/13; URQUIHART [Fuses] 10,514/14.

**Telephony and Telegraphy:** SAVIN [Telephone systems] 25,283/13; DENBIGH [Telephone meter] 25,437/13; EASTERN TELEGRAPH CO., FRASER and WOOD [Telegraph receivers] 28,952/13; PRATT & ORLINGS TELEGRAPH INSTRUMENTS SYNDICATE, LTD. [Signalling] 29,691/13; BETULANDER [Automatic and semi-automatic telephone systems] 6,210/14; GRAHAM [Telephone systems] 7,331/14.

**Traction:** MCKENZIE & HOLLAND, LTD., and EDMONDS [Signalling] 25,006/13; WILKINSON [Electric drive of motor-cars, boats, &c.] 27,611/13; WILLS and SYKES [Insulated rail joints] 7,884/14.

**Miscellaneous:** NEWITT & FLETCHER [Electric soldering irons] 25,621/13; MANDER [Pocket lamps] 7,079/14; HITZELSBERGER and NEW BRITISH EVER READY CO. [Pocket lamps] 17,025/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Incandescent Lamps:** BUENO Y TORRENS, 14,789/14.

**Switchgear:** MILLER [Switches] 21,593/14.

**Miscellaneous:** DOUGLAS and ANR. [Electric staff exchanges] 19,441/14; MARELLI [Electric machines] 20,782/14.

The following Amended Specification can now be obtained:—

**Telephony:** SIEMENS BROTHERS & CO., LTD. [Automatic system] 2,409/13 (see below).

### Applications for Amendment

22,408/09. **Tramcar Trucks.** J. E. ANGER (United Electric Car Co., Preston). Application has been made to amend this specification by limitation of claims. It describes improvements in the suspension of tramcar trucks.

### Amendments Allowed

2,409/13. **Automatic Telephones.** SIEMENS BROTHERS & CO., LTD. (*Siemens & Halske A.-G.*). Leave has been granted to amend this specification by way of disclaimer. The specification is of great length, with 25 claims and 38 figures, and describes a selective method of connection of subscribers' lines in an automatic or semi-automatic telephone installation.

13,006/13. **Ignition Devices.** UNTERBERG & HELMLE (Baden). Leave has been granted to amend this specification, which is for magnetos with perforated extensions to the pole-pieces to secure a broad peak to the E.M.F. wave.

### Opposition to Grant of Patents

19,842/13. **Brake Adjusters.** E. PECKHAM and S. THOMAS. Opposition has been entered to a grant on this specification, which is for automatic adjusting devices on tramcar brakes.

8,975/14. **Mine Signalling.** J. A. ADLINGTON. The grant of this patent, which is for an electrically actuated step-by-step mine signal indicator, has been allowed in spite of opposition.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

2,165/00. **Telegraph Poles.** E. H. CHAMBERS. Joints for tubular metal telegraph or other poles in which a seating is made inside a tube for the reception of one of smaller diameter by cutting off a wedge-shaped piece of the latter and fixing it inside the larger tube.

21,629/00. **Current Conversion.** W. du B. DUDELL. Converting continuous into alternating current of controllable frequency by means of the well-known "musical arc" or other similar device in a resonating circuit.

21,642/00. **Fuses.** J. C. A. WARD. A porcelain handle clip bridge fuse.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** G. E. HARRISON and J. G. BURNS [Insulating guard for linesmen] 16,136/08; P. T. KENNY [Combined picture moulding and conduit] 17,999/09.

**Electrochemistry and Electrometallurgy:** C. C. WALKER [Plating small articles] 17,384/06; S. JEVONS and V. D. GREEN [Welding] 18,036/09; M. SAUVAGEON [Electric furnace] 18,118/09.

**Incandescent Lamps:** A. C. HYDE [Mounting of filaments] 17,817/07.

**Storage Batteries:** R. M. LLOYD [Battery for launches and submarines] 15,818/01.

**Switchgear, Fuses and Fittings:** H. HUBBEL [Chain-pull switch lamp-holder] 15,801/01.

**Traction:** B. G. LAMME [Regenerative control of single-phase motors] 5,508A/07; C. B. HOLMES and A. DALLEN [Trolley leads] 14,480/08.

**Miscellaneous:** E. TYER and F. T. HOLLINS [Multiple relays] 17,000/04; W. TAYLOR [Magnetic tester of temper of steel] 15,809/05.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Chili has prohibited telegrams in code or cipher.—The South American Cable Co. states that their deferred service is resumed.—The Spanish Administration has applied Article 8 of the Convention.—On the 12th inst. normal conditions again prevailed in the interior of Haiti.—Communication with Dombé Grande Quilengues Angola is restored.—The Bulgarian Administration states that, owing to great pressure of traffic, they are unable to take responsibility for delays for or *via* Bulgaria.—Servia has also now applied Article 8 of the Telegraph Convention. Private telegrams are submitted to censorship and sender's risk.—Traffic *via* Zante is subject to delay owing to pressure of business, and the office at Rome will not take any responsibility for delay on telegrams to Italy and beyond.—According to the ruling of the German Military Authorities, Luxemburg notifies that telegrams to that State must be written in plain German, and are subject to censorship.—Turkey prohibits telegrams from hostile States either

destined for or in transit *via* that country.—The Province of Angola has applied Article 8 of the Telegraph Convention. No applications for refunds will be entertained. Only telegrams written in plain Portuguese, French, or English, with sender's signature, will be admitted, and they are subject to censorship and sender's risk.

The Marconi stations in New Jersey which have been built to communicate with the stations recently opened at Carnarvon are now completed, and some notes thereon appear in the *Wireless World*. As at Carnarvon the transmitting and receiving stations are some distance apart, the former at New Brunswick and the latter at Belmar, overlooking the Shark river. The station building at the latter is at the foot of the hill by the river, and the aerial stretches away up-hill to the west for about a mile, supported by eight masts each 300 ft. high. The wires are kept taut by steel cables and counterweights. The situation being on rather marshy ground near a river, an exceptionally good earth can be obtained by burying a network of copper wires and zinc earth plates. These plates are placed in a circle with a radius of 100 ft. The site of the New Brunswick station is at the correct distance and bearing for duplex working, and adjoins both a canal and a stream, and a somewhat similar but more elaborate earth connection is employed.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### SHOP LIGHTING

WE have before us an attractive illustrated booklet on shop lighting, which the British Thomson-Houston

FIG. 1.—SUITABLE AND UNSUITABLE LIGHTING.

FIG. 2.—A BRILLIANT SHOP WINDOW.

Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), has just produced, in which the requirements of adequacy,

distribution, diffusion, and economy, so important for shop lighting, are discussed, and a number of installations designed by the company are illustrated, employing Mazda lamps in the firm's special reflectors. These illustrations, of which we reproduce a few, range over almost every class of business, and in crude examples, both of direct and indirect lighting. One very effective illustration, reproduced in Fig. 1, shows a tobacconist's window, half of which is lighted in the

FIG. 3.—A NEW METHOD OF INTERIOR LIGHTING.

ordinary way by unshaded lamps and the other half by lamps in suitable reflectors. Fig. 2 is another good example of shop window illustration, where practically all the light is concentrated on the goods to be displayed; and Fig. 3 shows the interior of a chemist's shop, lit in a new way by lamps with suitable reflectors behind opal glass panels round the upper part of the wall. The booklet is very well produced, and has a very artistic cover design executed in Wedgwood blue.

An "Equiluxo" Ash Tray.—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have sent us a handsome ash tray moulded in their well-known "Equiluxo" glass to a design possessing distinct artistic merit. This glass is now used extensively in the form of bowls and spheres for lighting the better-class showrooms of large drapery establishments, stores, &c. The company inform us that this glassware has been installed throughout Messrs. Robinson and Cleaver's new premises, the ground floor of Messrs. Harrods, and the "Saxone" Shoe Company's branches among other places. The General Electric Co. will be pleased to present one of these ash trays to any interested inquirer about "Equiluxo" glassware.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**GLASSWARE.**—A new and complete list of their well-known scientifically designed prismatic glass shades and reflectors has been issued by Holophane, Ltd. (12 Carteret Street). All the latest forms are included, and among them special attention may be called to the patterns designed for use with half-watt lamps.

**CASING, STRIP LIGHTING, &c.**—A collection of leaflets from the Linolite Co. (25 Victoria Street, S.W.) give particulars of the latest forms of their well-known "Tubolite" system of strip lighting, of their "Woodhouse" steel casing, and certain other non-electrical products. It is pleasant to be able to announce that the whole of these articles are British made, and that the prices of the tubolite lamps and fittings show a slight reduction.

**ADJUSTABLE FITTINGS.**—A card from Dugdill's Patents (Failsworth, Manchester) illustrates a large number of designs of this firm's well-known convenient and moderate-priced adjustable fittings with self-sustaining joints.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**RADIATORS.**—A list from J. & W. B. Smith (15 to 23 Farringdon Road) illustrates a large number of designs of radiators of British manufacture, both of the lamp and "hot-bar" types.

**HEATING AND COOKING APPARATUS.**—The Dowsing Radiant Heat Co., Ltd., have issued a new complete list of electric heating and cooking apparatus, as well as a convenient abridged list. Several new patterns of radiator are included, fitted with the patent Dowsing-Huntley hot-bar element. These are provided with a back reflector, so that the heat is all thrown forward into the room with no loss by radiating heat to the walls. The cooking ranges are also fitted with this element, and it is interesting to note that many of these bars have now been working as long as 4,000 hours without showing signs of deterioration. Other articles listed are soldering irons and domestic and laundry irons, &c., formerly made by Eastman & Warne, whose business was recently purchased by the Dowsing Co.

## EMERGENCY MARINE LIGHTING SETS

IN view of the fact that the Convention on "Safety of Life at Sea" recognises emergency lighting sets as essential on all passenger liners, John I. Thornycroft & Co. have developed a special series of oil-driven sets of the type illustrated here. Examples of these have recently been installed on the Canadian Pacific boats *Missanabic* and *Metagama*. The sets consist of plain shunt-wound protected type two-bearing continuous-current 40-kw. 110-volt dynamos, direct-driven by six-cylinder Thornycroft 70-h.p. paraffin engines. The vaporiser is arranged that its temperature can easily be varied to suit different grades of fuel, while the engine may be started immediately on petrol and changed over to paraffin within five to ten minutes, or started on

EMERGENCY OIL DRIVEN SHIP LIGHTING SETS.

paraffin by a lamp. Half-compression cams are fitted to facilitate starting, and the cooling water is circulated through a special type of cooler by a rotary gear pump. This closed-circuit cooling arrangement is adopted in preference to taking the suction direct from the sea, on account of such sets frequently being placed on large ships as much as 80 ft. above sea-level. The cooler consists of a revolving drum dipping in

water and with a current of air driven over its surface by a fan. The loss of water per hour is about 1·6 gallon. These sets are usually installed in a steel compartment on the boat deck with the switchboard controlling their circuit, and are entirely self-contained. They are compact, silent, economical, light, and easily handled, and are of the most robust construction. Similar sets are manufactured in various sizes ranging from  $3\frac{1}{2}$  to 100 kw.

## ELECTRIC HEATING APPARATUS

THE numerous items of electric cooking and heating which have been brought out lately by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), and represent the manufacturing output of no small part of their Ilceue Works, Birmingham, are now brought together in an attractive new catalogue. Our readers are already familiar with many of these, such as the "Magnet" fires (ELECTRICAL ENGINEERING, Nov. 5th, p. 580), but there are some general features and particular novelties that we should like to refer to. In addition to the "Magnet" fire, the Company make another heater of the "rod" type (see ELECTRICAL ENGINEERING, May 14th, p. 232), where the heat is a little more

FIG. 1.—LATEST PATTERN GRILL.

concentrated into a comparatively small number of separately replaceable glowing bars formed of wire-wound rods of refractory material. Both these and the more familiar lamp radiators are made up in styles from the simplest to the most ornate, and non-glowing heaters or convectors in many forms are also listed. The great feature of the cooking appliances, and, indeed, also of such items as the flat irons and soldering irons, is the use in all cases of easily interchangeable heating elements, although happily the occasions for replacing them are becoming rarer and rarer. The whole series, ranging from kettles to complete domestic cookers, is too extensive to particularise, but we may mention that householders of every class of pocket are appealed to. One of the very latest grillers with two heats (750 watts each) is illustrated in Fig. 1. Attachments are made to fit over these

FIG. 2.—UNIVERSAL TRAVELLING OUTFIT.

to form complete portable ovens, and a very suitable set for small flats where space is limited results. Several grades at different prices are made. Another novelty illustrated in Fig. 2 is a travelling universal voltage set, in which an iron with both high- and low-tension windings has suitable accessories to convert it into a hot-plate, water-boiler, or curling-iron heater. Among other articles listed are sterilisers, self-contained saucepans and frying-pans, urns, toasters, cooking plates and warming plates, such industrial appliances as glue-pots, sealing-wax heaters, and soldering irons, and such miscellaneous apparatus as curling-iron heaters, cigar lighters, and electrically-heated hat-pads, carpets, and foot warmers.

**New Members of B.E.A.M.A.**—The following firms have recently been elected "Members" of the Association:—Ashworth & Parker, Greenwood & Batley, Ltd., Sandycroft, Ltd. The Harland Engineering Co. has been elected an "Associate."

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Blackrock.**—A loan is to be applied for in connection with the new electric lighting scheme.

**London: Hammersmith.**—An application is to be made to the L.C.C. for sanction to a loan of £10,000 for additional machinery, mains, transformers, meters, and services.

**Middlesbrough.**—Cable to supply North Ormesby district at an estimated cost of £550.

**Selby.**—A special meeting is to be held to consider the question of electric lighting.

**Watford.**—A loan of £1,331 for meters has been sanctioned.

**Winchester.**—One 500-kw. D.C. turbo-generator, condensing plant, &c. City Electrical Engineer. Dec. 17th.

**Worcester.**—The question of adopting electricity for all purposes at the sewage works is under consideration.

### Wiring

**London: L.C.C.**—160 wiring points at Star Lane Elementary School. Clerk. Dec. 9th. (See advertisement on another page.)

**Paddington.**—Central Baths, Porchester Road. Nov. 26th. Town Clerk.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdeen.**—Examination Hall at King's College (£14,000).

**Birmingham.**—Electrical equipment of infirmary at an estimated cost of £7,600.

**Colchester.**—Additions to hospital (£3,110).

### Miscellaneous

**West Ham.**—Three months' supply of electrical fittings for the Guardians. Clerk, Union Road, Leytonstone, N.E.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £58 5s. to £58 15s. (Last week, £55 5s. to £55 10s.)

**Change of Telephone Number.**—The telephone number of the General Electric Co., Ltd., Glasgow Branch, is now 309 Central, 4 lines.

**Agency.**—We are requested to state that the address of the Irish agent of Simplex Conduits, Ltd., is 88 Wellesley Avenue, Belfast.

**Russian Agencies.**—The Board of Trade Intelligence Department has the name and address of a gentleman in Kharkov who wishes to take up an agency of British firms dealing with electric tramways, electric lighting, and equipment of mines.

An engineer in Ekaterinoslav also desires to obtain supply of metal- and carbon-filament lamps, dynamos and motors, ventilators, and other electrical apparatus.

**Dutch Agency.**—An Amsterdam firm wishes to secure the representation of United Kingdom manufacturers of electric motors. Further particulars at 73 Basinghall Street, E.C.

## APPOINTMENTS AND PERSONAL NOTES

Mr. P. Walter d'Alton, for many years Chief Mechanical Engineer on the staff of Messrs. Dick, Kerr & Co., has opened offices at Cross Keys House, 56-58 Moorgate Street, and begun practice as a Consulting and Inspecting Engineer.

Mr. G. S. Helme has resigned his appointment of representative of the Electrical Co., Ltd., in Scotland.

The East Indian Railway Co. requires an assistant elec-

trical engineer. Salary 450 rising to 600 rupees per annum. Four years' agreement. Secretary, Dec. 7th.

Electrical fitters are required at H.M. Dockyard, Portsmouth. Applications to Electrical Engineer, Portsmouth Dockyard.

Shift engineers are required at Belfast and Birmingham; a switchboard attendant at Watford; a draughtsman in the Stoke-on-Trent Tramways Depot; and a testing assistant by Messrs. Bruce Peebles & Co.

## LOCAL NOTES

**London: St. Pancras: Purchase of Copper.**—As reported in our columns a short time ago, the Council has decided to replace the old Henley cable in the Borough by new feeders, the work to be carried out as occasion requires, in order to alleviate as much as possible the anticipated distress amongst the unemployed due to the war. In the ordinary course the cable would have been ordered as required at the lowest prices quoted. The present lowest price quoted is for copper at £57 per ton, but the Western Electric Co. has informed the Electricity Committee that they have had the opportunity of purchasing a sufficient quantity of copper for the Council's cable requirements for the next two years at the very low price of £54 per ton, and the Company is prepared to do so if desired. The Committee recommend that this suggestion be adopted, the Company merely buying in advance on behalf of the Council and charging as the various quantities are ordered. Thus the charge for cable will only vary according to the price of lead at the date of order for each consignment.

**Marylebone: Battery Maintenance.**—The dispute between the Council and the Electrical Power Storage Co., which has been going on for some time and related to the maintenance of the batteries at the Rathbone Place and Manchester Square sub-stations, has now been settled after reference to Mr. J. Swinburne, F.R.S., as arbitrator. The Council had claimed that the Company had been lax in their maintenance of the batteries in question, but a compromise has now been arrived at apparently satisfactory to both sides.

**Willesden: Supply to Guardians.**—Some time ago the Guardians entered into an agreement to dismantle their own generating plant and take current from the Council. They now report that during the year to Oct. 19th, 1914, there has been a net increased cost of £363 over that incurred when using their independent plant. A suggestion is made that the agreement should be cancelled, but the Council are not willing to adopt this course. The Guardians therefore have accepted a proposal that they shall cease taking current from the Council from Dec. 1st for a period of twelve months, and during that time use their own plant, retaining the Council's supply as a stand-by on terms to be agreed. This, it is thought, will enable a more efficient test to be made as to the comparative cost of the two methods of supply.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Edison & Swan United Electric Light Co.**—At the annual meeting last week the report and accounts given in our issue for Nov. 12th, p. 594, were adopted. Mr. C. J. Ford, the Chairman, who presided, said that the works were at present very full, and so far the company had not felt any ill effects from the war. The war had had one beneficial effect in stopping the importation of German lamps, &c., and he hoped that after the cessation of hostilities the British public would continue to decline to purchase these German goods, and wholeheartedly support British manufacturers. The company had brought their goods prominently before the public by means of advertising, and he was pleased to say that the results obtained had in every way warranted this expenditure.

**CAPPER PASS & SON, Ltd.,**  
Bedminster Smelting Works, BRISTOL.

SELLERS OF  
**ANTIMONIAL LEAD OF ALL GRADES**  
BUYERS OF  
**LEAD ASHES & LEAD RESIDUES FROM ACCUMULATORS.**

## SUMMARY

THE new three-phase power house adjoining the old continuous-current station at Hackney and the new sub-stations required for the introduction of three-phase transmission into the system are now working. A description of the plant is given (p. 616).

DR. A. H. RAILING's address to the Birmingham Local Section of the Institution of Electrical Engineers contained a general survey of the position of electrical engineering in civilisation (p. 617).

THE Nottingham Electricity Department make a charge for providing a consumer's fuse-box. A consumer disputed their right to make this charge, but the Judge held that it was justified (p. 617).

IN our "Questions and Answers," the construction of a search-coil for fault localising is dealt with (p. 617).

THREE new types of electric miner's lamps have been approved by the Home Office (p. 618).

THE maintenance of electric miner's lamps was dealt with in a paper recently read by Mr. W. Maurice before the Association of Mining Electrical Engineers (p. 618).

PATENT specifications relating to electric miner's lamp igniters and electric furnaces have been published during last month (p. 620).

THE subjects of the specifications published at the Patent Office last Thursday include metal filaments, cookers, soldering irons, engine starter, automatic telephones, and insulated rail joints. A patent for neutralising static charges appearing on textile materials during manufacture expires this week (p. 621).

THE third rail system is being employed in America for pressures as high as 2,400 volts (p. 621).

SOME American investigations into the variations in the absorption of the electric waves used in wireless telegraphy are referred to (p. 621).

THE Advanced Grade Question Paper in Lundbergs' Electric-Light Switching Competition is published on p. 622.

OUR Trade Section describes a new electric heater for fixing on doors, and refers, among other subjects, to shop lighting, new fittings, and recent designs of switchgear (pp. 623 and 624).

TWO 8,000 kw. turbo-generators are required by the L.C.C.; further borrowing powers of £543,000 are contemplated by the Manchester Corporation; and loans are contemplated at Stoke-on-Trent, £44,000; Oldham, £40,000; Redditch, £18,000; and Islington, £4,975.—Two water-tube boilers are required at Tunbridge Wells (p. 625).

THE Yorkshire Electric Power Co. is renewing its application to Parliament for lighting powers.—Some satisfactory street lighting tests have been carried out at Peterborough.—A point in connection with consulting engineers' etiquette has arisen at Slaithwaite (p. 626).

**Arrangements for the Week.**—Tuesday, Dec. 8th.—Institution of Electrical Engineers, Scottish Section, at 207 Bath Street, Glasgow. "The Magnetisation of Iron at High Flux Density with Alternating Currents," by J. S. Nicholson. 8 p.m.

Wednesday, Dec. 9th.—Association of Engineers-in-Charge. St. Bride's Institute, Bride Lane, Fleet Street, E.C. "Electricity in the Printing Office," by Frank Broadbent. 8 p.m.

Thursday, Dec. 10th.—Institution of Electrical Engineers. "Automatic Protective Switchgear for Alternating-Current Systems," by E. B. Wedmore. 8 p.m.—Greenock Electrical Society. "The Electrical Equipment of a Liner," by J. E. Allan.

Friday, Dec. 11th.—Electro-Harmonic Society Smoking Concert, Holborn Restaurant. 8 p.m.

**Institution of Electrical Engineers.**—The following is the result of the ballot at the meeting on Thursday:—*Member*:—A. McKinstry. *Associate Members*:—A. A. Anderson, Lieut. B. Binyon, R.N., W. De Renzy, W. H. Lang. *Graduates*:—T. M. Carey, T. J. Dale, W. C. Harrison, A. W. Marr, H. Norman, H. A. Rickwood, R. S. Whaley. *Students*:—G. J. Abbott, C. Dawnay, H. W. Gilbert, C. L. Hyde, L. A. Khan, C. F. Partridge, S. R. Sahgal, H. E. Skinner, C. H. Stubbings, J. T. Tosta.

*Candidates transferred*:—*From Associate Member to Member*:—J. A. Hay, W. S. Lonsdale, J. C. Matthews, E. H. Westwood. *From Graduate to Associate Member*:—H. Price. *From Student to Associate Member*:—H. Carey-Thomas, W. M. Cranston, L. W. Goddard, C. H. Goulden, L. C. Martin, W. B. Smith. *From Student to Graduate*:—J. P. Annacker, C. C. Brazier, P. S. Dubash, L. P. Hugo, F. P. Matthews, J. W. Munro.

**The Crystal Palace School of Engineering.**—We are requested to state that the present occupation by the Admiralty of the Crystal Palace does not in any way affect the School. The work, which is now entering on its forty-third year, is being carried on as usual, and the School is being developed and extended under the auspices of the Trustees.

### THREE-PHASE SUPPLY AT HACKNEY

AT the invitation of the Electricity Committee of the Hackney Borough Council, a number of visitors were given the opportunity last Saturday of inspecting the 3-phase plant in the Hackney generating station and one of the sub-stations which has just been completed. The Hackney electricity undertaking dates from 1901, and up to this last extension, only continuous-current plant was in use. In 1912, however, a new scheme was prepared by Mr. L. L. Robinson, Borough Electrical Engineer, and approved by Messrs. Preece Cardew & Snell, which involved the erection of an entire new 3-phase power-house adjoining the old one in Millfields Road, a ring main system, and three sub-stations. The first instalment of this plant is now complete and forms a fine example of modern central station equipment. The occasion of the inspection was quite informal, but over 100 persons were entertained to tea at the station, where a speech of welcome was made by the Mayor, Mr. L. S. Johnson, after which Mr. T. A. Blane (Chairman of the Electricity Committee) called attention to the financial side of the undertaking, and Mr. Robinson modestly referred to the technical features of the scheme for which he is responsible. Most of the company were then taken in cars, kindly provided by the Council, to the Dalston Lane sub-station, where the converting plant and distribution arrangements were inspected.

The new power-house strikes us at once as spacious, well-arranged, and straightforward in its design. The engine-room is in line with the old engine-room, and the new boiler house is at right angles, both arranged to be capable of considerable future extension. Steel frame construction with concrete panelling is employed, and the whole structure is as fireproof as possible. In the engine-room, there is room for one 3,000 kw. and two 5,000 kw. turbo-alternators, of which the first is now running, and one of the latter is on order. Between the main part of the new engine-room and the old, a 1,500-kw. Bruce Peebles-La Cour motor-converter has been installed, which forms the electrical connecting link between the old and the new plant. The new generating set consists of an alternator made by the General Electric Co., Ltd., rated at 3,000 kw. at 0.85 power factor, 6,000 to 6,600 volts, three-phase, 50 cycles, at 1,500 r.p.m., and capable of 50 per cent. overload for half an hour, and 25 per cent. for two hours. The machine is ventilated by air drawn through a Baleke dry cloth filter, and a separate exciter is coupled to its shaft. The set is driven by a standard turbine of the disc and drum type manufactured by Willans and Robinson, Ltd. (Rugby). The following details of steam consumption will be of interest:—

*Steam pressure, 200 lbs. per sq. in., steam temperature, 550° F.*

Steam consumption in lbs. per kw. hour			
Load.	Guaranteed.	Expected.	Vacuum.
$\frac{1}{2}$	15.25	14.75	28 ins.
Full	13.95	13.5	28 "
$1\frac{1}{2}$	15.25	14.75	26.8 "
$1\frac{1}{2}$	16.9	16.3	25 "

The above figures include the steam for the augmentor set.

The condenser plant, also by Willans and Robinson, is, as usual, underneath the set, and is equipped with an Edwards' type air pump, with separate force pump, driven by a B.T.-H. motor. Condensing water is derived from the river, and two 36-in. pipes are provided from the pump house on the bank, which contains a vertical shaft Rees Roturbo pump, driven by a Laurence Scott motor.

The new boiler house at present contains two Babcock and Wilcox land type water-tube boilers with chain-grate stokers and superheaters, each capable of evaporating 33,000 lbs. of water per hour, and working at 200 lbs. per sq. in., with superheat up to 600° F. The ejector type of force draught equipment is fitted, with a fan by Davidson & Co., driven by a Westinghouse motor. A 520-tube Green economiser is provided above the back of the boilers, and steam driven air pumps, by J. P. Hall & Co., are used. A very complete coal handling plant has been provided by W. J. Jenkins & Co.; this takes coal from the adjoining river and conveys it along a telfer line to the overhead bunkers. The coal is weighed on the start of its journey, as well as when it leaves

the bunkers, on entering a travelling shoot which can deliver coal from any of the four bunker outlet valves to any stoker. The motor driving all this plant was supplied by the British Thomson-Houston Co., Ltd. All the auxiliary motors are run from the continuous current bus-bars and are controlled by substantial pillar type motor panels by Brook, Hirst & Co. With regard to the steam side of the equipment, it only remains to say that the contractors for the pipe work were the Brightside Foundry & Engineering Co., Ltd., and that the steam valves are of the Hopkinson pattern.

The main switchgear is of the standard Ferranti type with all the H.T. gear in cells in a room directly under the control board. The oil switches are hand-operated by levers of the signal-box type. Duplicate bus-bars are provided, and panels are provided for one 3,000-kw. and one 5,000-kw. alternator, the 1,500-kw. motor-converter, and two 0.15 sq. in. three-core feeders. A Taylor-Scotson regulator is installed for voltage regulation, and Merz-Price protection is provided for the feeders. The connecting cables to the machines were supplied by British Insulated & Helsby Cables, Ltd. They are three-core, paper-insulated, lead-covered, armoured where subject to rough usage, and with copper shield where employed for extra high tension.

The La Cour converter already referred to has a rated D.C. output of 1,500 kw. at 500 to 575 volt., and runs at 273 r.p.m. When running inverted it gives 1,350 kw. at 6,000 to 6,600 volts 50 cycles three-phase in parallel with other machinery. The guaranteed efficiencies are as follows: A.C. to D.C., full load, 92.25 per cent., three-quarter load, 91.75 per cent., and half load, 90.5 per cent.; D.C. to A.C., full load, 91.5 per cent., three-quarter load, 91 per cent., half-load, 89.5 per cent. The starting current from A.C. to D.C. is 30 per cent. of full-load current, and from D.C. to A.C., 10 per cent. The set can be started from either side.

The E.H.T. mains from the station to the new sub-stations are of some interest, and are laid in fibre conduits of the well-known and excellent type made by the Key Engineering Co. These conduits are 4 in. internal diameter with turned socket joints lapped with compounded tape. They were laid in concrete by Foot & Milne, Ltd. The line of this conduit extends from the power-house to the Northwold Road sub-station, thence to the Dalston Lane sub-station on to Balcombe Street sub-station, and back to the power-house. The shortest routes have not been taken, but consideration has rather been given to positions it will be desirable to connect on to the ring mains in the future. The length of conduit line is about 10,000 yds. Six conduits are provided round the northern half of the ring and nine conduits round the south; a total of about fifty miles of actual conduit is therefore used. It may be noted that the capacity of the system when these conduits are filled can be immediately doubled by laying a set of conduits diametrically across the area from the power-house to Dalston Lane sub-station. The main feeder ring drawn in at present consists of one 0.15 sq. in. three-core paper-insulated copper-shielded lead-covered cable, made by British Insulated & Helsby Cables, Ltd., and laid by the works staff. In addition, pilot and signal cables have been drawn in for working in connection with the Merz-Price protection gear, &c. The former is a three-core paper-insulated lead-covered cable, and the latter is a six-pair dry-core, lead-covered cable.

At present the capacity of the plant in each of the three sub-stations is 1,100 kw., but there is room for considerable extension and for the addition of a battery at each. Also the old station will gradually become a fourth sub-station. The converting plant consists of two 500-kw. La Cour converters, supplied by Bruce Peebles & Co., Ltd., at each sub-station. The sub-station switchgear is by Johnson & Phillips, Ltd. It may be mentioned that spark-gaps and "Brazil" carbon trough resistances are installed for dealing with surges in the E.H.T. system.

A certain amount of low-tension feeder cable has been supplied in connection with the new scheme by British Insulated & Helsby Cables, Ltd., consisting of concentric and triple concentric cables, paper insulated and lead covered, either armoured and laid direct in the ground or on the solid system in earthenware troughs. Very few new feeders will be required for many years to come, as existing feeders, which used to carry the supply from the works right across the area and necessarily working at a low-current density, are being cut near the sub-stations and looped in. Thus each old long feeder will become three short feeders, which can be worked at a much greater current density. Thus the energy carrying capacity of the old copper will be increased nearly six-fold.

## ELECTRICAL ENGINEERING AND PROGRESS

IN his chairman's address to the Birmingham Local Section of the Institution of Electrical Engineers, Dr. A. H. Railing made a comprehensive review of the position of electrical engineering in the world's social organisation. He considered how the evolution of civilisation had led to an age of specialisation, and how electrical engineering, one of the latest of the professions, came into being as a separate entity. He then started to answer the question of how far electrical engineering had in its turn contributed to human development, progress, and efficiency. He attacked the matter in some detail, and in a reasoned argument, illuminated with a fine blend of exact science and philosophic speculation, he showed how electricity was the most easily converted, transmitted, and applied form of energy, and had enabled us to make better use of matter by increasing the number of varieties in existence, by producing them more cheaply, and by making better use of their properties; it had enabled us to make better use of the available energies, and by facilitating locomotion and communication had increased the space that could be inhabited and made use of by men, and it had increased the physical and mental power and efficiency of individuals and human society as a whole. Summing up, he said:—"Electrical engineering has led to better understanding, a more extended use, and a more efficient use of nearly all existing matter and energy. It has led to a better understanding of animal and human organisms and problems. It has bridged space and time and minimised their influence where they become resistance factors against energies mental and physical; it has increased the efficiency of individual and society; it has, therefore, established its claim to be one of the most valuable factors in the progress of mankind."

## WHO SHOULD PAY FOR THE SERVICE BOX

JUDGMENT was given in the Nottingham County Court in an interesting case in which the Nottingham Corporation sued a consumer for 9s. 6d. for a fuse-box in his house. From the evidence given by Mr. Herbert Tulbot, the City Electrical Engineer, it appears that consumers have hitherto always paid a charge for their fuse-boxes, without disputing it. In the present case, however, there was the additional reason for the consumer to pay because he was not satisfied with the box he had had previously, and wanted a new one. The judge gave his decision in favour of the Corporation, adding that he considered the charge for a terminal box justified in accordance with the Electric Lighting Acts, which permit of a charge being made for "electric lines" within consumers' premises. "Electric line" is defined in the Acts as "a wire or wires, conductor . . . or any apparatus connected therewith." We hardly expect that the defendant in this case will appeal, as the amount in question is so small, but it is a question upon which it would be useful to have a decisive opinion. Under the Board of Trade regulations, the supply authority is bound to insert a service fuse in a locked or sealed receptacle in the consumer's premises, and except in particular cases in which a special pattern of fuse or box has been required by the consumer, it has been unusual to charge for this.

**Municipal Wiring.**—A number of municipalities will ask for powers next session to deal in electric wiring and fitting, and also to hire out motors and apparatus. The Edinburgh Corporation seeks only to hire out motors and cooking, heating, and ventilating apparatus, also to maintain showrooms. The Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board merely asks for power to maintain showrooms. In the Plymouth Corporation Bill it is proposed to sell or hire electric fittings, and to fix same; the Doncaster and Dewsbury Corporations seek to deal in apparatus for both lighting and power and similar powers, whilst the South Shields Corporation is still more specific, and proposes also to "supply and fix wiring, and to demand and take rents and charges therefor."

**The Association of Supervising Electricians.**—Mr. A. H. Dykes presided at the annual dinner of this Association last Saturday, and in his principal speech paid a glowing tribute to the work of British electricians at the front, and referred with approval to the Association's encouragement of the apprentice system. The sum of £4 12s. was subscribed for the Belgian refugees during the evening, and an excellent musical entertainment was provided. The total membership is now seventy-two.

QUESTIONS AND ANSWERS  
BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

## QUESTION No. 1,419.

Describe briefly the general design and give particulars of efficiency and working of static balancers for use with 440-volt 3-wire D.C. dynamos, which can be worked either shunt or compound wound, whichever is the more suitable. Two generators will be used of 100 and 50 kw. respectively, both direct-coupled steam sets, running in parallel when the load is heavy; further, for peak loads a battery is also put in parallel. The plant is used for factory driving and lighting. The battery has to be charged during the daytime. State briefly also what extra switchgear and instruments would be required.

(Answers must be received not later than first post Thursday, Dec. 10th.)

## ANSWERS TO No. 1,417.

I wish to construct a suitable search coil for fault localising, and should be grateful if anyone will furnish me with particulars of wire to be used and the gauge and length required to give an audible buzz when passing about 10 amps. through the fault by means of an interrupter, and also the resistance of a "buzzer" to suit.—"ALPHA."

An award of 10s. is made to "FAULT" for the following reply:—

The following is a description of a search coil for fault localising, constructed by the writer and used with success.

The coil is wound on an equilateral triangular frame, 12 in. side and 3 in. wide, and of  $\frac{3}{8}$ -in. wood; 1,000 turns of No. 30 S.W.G. double cotton-covered wire are employed. The coil is wound in sections and connected together in series, making sure that the ends are connected together properly. The ends are connected to the buzzer by means of a strong flexible cable. For a buzzer the writer used a pair of fairly high resistance telephone receivers connected in series, which were mounted on a frame to fit the operator's head.

"Fault" assumes that by the term buzzer, "Alpha" means the telephone which is connected to the search coil and emits the buzz, and not the interrupter.

No second award is made, but we may mention that, in an interesting communication "L. R." (who wrongly recommends a circular search coil) points out that some care will have to be taken in constructing an interrupter to make and break 10 amperes in the cable circuit, and suggests that a much smaller current should be used.

## ANSWER TO CORRESPONDENT

**R. HORE.**—All that is required to increase the speed of your shunt-wound motor is to insert a resistance in the field circuit to weaken the field. The machine, however, when running on a weak field in this way will not have such a good overload capacity.

**The Association of Consulting Electrical Engineers.**—We have received a copy of a booklet which the Association has issued for the guidance of the public and the profession containing a scale setting out the usual professional fees, and the rules under which the members of the Association work.

# ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

## ELECTRIC MINERS' LAMPS

A HOME OFFICE Order (No. 1,510) approves the following additional types of electric miners' lamps:—  
*The Bristol Safety Lamp, Type B.T. 4 V.* (made by the Bristol Electric Safety Lamp Works, 40 Great Smith Street, Westminster).

A section of this lamp is shown in Fig. 1. It has a case of steel, brass, aluminium, or aluminium alloy, and the accumulator is constructed to prevent escape of the liquid whilst allowing the escape of gas generated by chemical action. The cover, hinged to the case, forms a flame-tight connection with it, and a base plate or bezel of aluminium or brass, secured to the cover, carries the bolt, reflector, protecting glass, and guard; the glass is cemented to a retaining ring screwed to the base-plate and locked to a brass slide by a pin, and held in the locked position when the cover is closed by another pin on the upper edge of the case, which projects through the case and engages a hole in the slide. The slide bracket is screwed to the cover from the inside. The flame-tight switch consists either of a metal sliding plate, the outward movement of which is limited by a pin or a rotary stem working in a tube. A flame-tight joint between the external end of the tube and the head of the stem is maintained by a washer of vulcanite or suitable material, close contact being ensured by a spring.

The lamp is specified to weigh not more than 4½ lb., and to give 1 c.p. all round and 1½ c.p. over an arc of 45° in a horizontal plane for nine hours.

*The Manley and Sandy (M. & S.) Miners' Electric Safety Lamp (with Electric Gas Indicator)* [made by Manley & Sandy, Ltd., Letchworth.]

The cover of this lamp, which is shown in Fig. 2, carries a hollow aluminium cylinder with a flanged base by which the cylinder is secured to the cover, the cylinder forming a flame-tight joint with the cover by means of steel screwed pins riveted on the inside of the cover. The cylinder contains an electrical device constructed for the purpose of indicating the presence of fire-damp. Communication with the outside atmosphere is made through an opening covered by double securely fixed gauzes of not less than 28 S.W.G. steel or copper wire, 784 meshes to the square inch. The cylinder is provided with an aluminium top plate which carries the bulb and a conical reflector, and forms a seating for the protecting glass. The base of the flanged cylinder carries 4 or more steel or iron pillars which support the aluminium crown. An aluminium plate carrying a conical reflector is screwed into the crown and is firmly secured thereto by a set screw locked by a soldered steel wire. The flame-tight screw switch operating the lamp, and a flame-tight spring switch operating the gas-indicating device, are both situated in the aluminium cylinder.

It is pointed out that this lamp has passed the official tests with the electrical gas-indicating device embodied in its construction, but the device itself does not require the approval of the Secretary of State, and its efficiency as a means of indicating gas has not been tested.

The *Bristol Safety Lamp Type B.R. 4 V.* is also approved for use by officials or for special purposes only. It is a modification of the Bristol lamp described above, but of the bull's-eye pattern.

The complete list of approved electric mining lamps is now as follows:—

*For General Use.*—"Bristol, Type B.T. 4 V." (Bristol Electric Safety Lamp Works), "B.A.C." (British Accumulator Co., Ltd.), "Ceag" (Ceag Electric Safety Lamp Co.), "Turquand-

Kingsway" (General Electric Co., Ltd.), "Gray-Sussmann, Nos. 3 and 4" (W. E. Gray), "Manley and Sandy (M. & S.)" (Manley & Sandy, Ltd.), "Joel-Fors, Type 403 M." (John Mills & Sons).

FIG. 1.—BRISTOL SAFETY LAMP.

FIG. 2.—MANLEY AND SANDY LAMP WITH GAS DETECTOR. (Scale ½.)

"Oldham" (Oldham & Son), "Thomson-Rothwell" (Rothwell & Co. and the Thomson Co.), "Varta" (Tudor Accumulator Co., Ltd.), "Wolf, Alkaline," "Wolf, Lead," and "Wolf, No. 2" (Wolf Safety Lamp Co.).

*For Officials and Special Purposes only.*—"Bristol, Type B.R. 4 V." (Bristol Electric Safety Lamp Works), "Float Patent" (Float Electric Co., Ltd.), "Joel-Fors Electric Inspection Lamp, Type 303 C." and "Joel-Fors Electric Hand Lamp, Type 403 H." (John Mills & Sons), "Oldham Emergency" and "Oldham Shaft and Roadway, Types A and B" (Oldham & Son), "Varta, Type 2 Et 4" (Tudor Accumulator Co., Ltd.), "Wolf Rescue, No. 2" (Wolf Safety Lamp Co.).

## THE MAINTENANCE OF ELECTRIC MINERS' LAMPS

A LECTURE on this important subject was given by Mr. W. Maurice recently to the Warwickshire and South Staffordshire Branch of the Association of Mining Electrical Engineers. He emphasised the importance of not trusting the upkeep of such lamps to incompetent persons, and remarked that the care of storage batteries had always been a specialised branch of electrical work. He suggested that the electric lamp cabin ought to come under the supervision of the electrician of the mine. Complaints that electric lamps were unduly expensive to maintain were usually the result of bad management of the batteries. With 500 lamps the cost should not exceed 3d. or 4d. per week per lamp. The organisation of the lamp cabin for lamps with lead and alkaline batteries was much the same. Every cabin should have suitable charging apparatus whereby accumulators could be placed on stands and charged automatically in groups, and at the same time provision should be made for the cleaning and the washing-out of the cells, and the systematic handling of the lamps. For such repairs as might be rendered necessary in ordinary daily work, such as the dealing with some trivial damage to the casing and the cleaning of the glass or attention to the bulbs, suitable facilities should be provided. He would suggest that when they designed a cabin for a fairly large number of lamps, they should also provide

a photometer room in which photometric tests could be made. The lamp-room should be furnished with a proper supply of hot and cold water, and it would be all the better if stills were provided for the production of distilled water. The two main items in lamp-cabin costs were bulb renewals and battery renewals. If they were getting a life of 800 or 900 hours out of a 1½-c.p. bulb, they had no reason to make any complaints. Quite an appreciable amount of the life of the lamp was wasted, due to the inveterate habit of the miner of returning his lamp still alight, and quite a large proportion of the damage was due to his worse habit of banging the lamp down at the lamp-room window when handing it in. The simple expedient of a rubber mat had been found of great use in this direction. There was also great roughness in the way lamps were hit against the un-locking magnets.

As to the treatment of the battery, most of the storage batteries on the market were fitted in celluloid shells, with some kind of non-spilling valves which provided for the escape of gas when the batteries were being charged. To get the best results out of a lead accumulator it was necessary to charge it at a certain rate, and if that rate was exceeded the life of the plates would be very considerably reduced. At many collieries it had been the practice almost to ignore any such triviality as the rate of charging.

With regard to the lead accumulator and the length of its life, they might put that down as from 300 to 400 shifts, which was equivalent to about once a year.

Sometimes the negative would go twice as long as the positive, but sometimes it would not, and it was considered at some collieries a good rule to take them both out at the same time rather than to have the trouble to change first the positive and then the negative. The celluloid cell cases varied a great deal in quality. There was not the slightest economy in cheap cases. Heavily-built cases with easily detachable lids would stand refilling for a number of years. Reasonable care had to be taken to keep the celluloid away from sources of heat, owing to its inflammability, but the fire risk from this cause had been greatly over-estimated. Cleanliness in handling the lamps was essential; dirty contacts and terminals, and even handling the lamp-bulbs with oil fingers, had a marked effect on the light given. The lamp-bulbs should last from 800 to 900 hours. Many cells were ruined by being connected the wrong way round for charging, and he recommended the adoption of a wedge-shaped block at the base of the cell, so that it could only be inserted in the rack the right way. Wolf alkaline cells required very little special treatment. The whole secret of maintaining them in perfect condition lay in scrupulous cleanliness, keeping up the strength of the electrolyte, and taking every precaution to avoid the admission into the cells of dirt, and especially oil which, when mixed with the alkali, caused the formation of soap.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF NOVEMBER

### Mining.

THE only patent specification of special interest to mining electrical engineers published during last month by the Patent Office was No. 15,324, of 1914, of V. E. JOYCE and SPAGNOLETTI, LTD. This describes a simple form of electric relighting apparatus for miners' oil lamps, for use above ground. It consists of a stand containing a magneto-generator, worked by a handle through gearing, with the lamp contacts mounted on the top of the stand. The apparatus is for use only on the surface or in non-gaseous mines, as the lamp is not enclosed in a gas-tight chamber.

### Metallurgical.

A patent specification by F. J. MACHALSKE (No. 15,455, of 1914) published last month describes an electric furnace for smelting iron in which the bottom and lower portions of the sides are coated with artificially-made graphite carbon, while the adjacent parts of the walls are covered with magnesite.

**Home Office Prosecution.**—Last month the Greenside Mining Co., Ltd., and their manager, Mr. W. H. Borlase, were charged at Hackthorpe with using an electric locomotive with overhead conductors without consent of the Home Secretary. The defendants raised an objection on the ground that the special rules in question had not been received when the offence was committed. This objection was upheld by the Bench, but costs were not allowed.

## The STANDARD INSULATING VARNISHES

are proved to be of *practical* utility by their regular use by the leading Electrical Manufacturing Firms, Lighting and Power Stations, Tramways, Railways, &c.

Be guided by this experience instead of experimenting with *unknown* and *unproved* materials.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Nov. 26th, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

22,331/13. **Lamp Filaments.** C. O. BASTIAN. Helically-wound drawn wire filaments in which the wire is provided with a coating during preparation to keep the convolutions apart. This coating is removed after mounting the filament.

23,218/13. **Cookers.** R. S. DOWNE and the BROMPTON & KENSINGTON ACCESSORIES CO., LTD. Electric cookers comprising ovens with an inner shell of thin sheet metal enclosed within an outer shell consisting of a metal frame and compressed asbestos sheet panels, the space between the two being filled with slag wool or other heat insulator. (Two figures.)

25,621/13. **Soldering Irons.** L. NEWITT and F. P. FLETCHER. Electrically-heated soldering irons, with a handle that can be adjusted as to its angular position, with the bit and with several sub-divisions of the heating element controlled by a switch in the handle. (Three figures.)

1,227/14. **Engine Starter.** H. LUCAS and W. G. TURNER. Electric engine starter in which the pinion is drawn into gear by a solenoid with two windings, one in series with the motor when starting and of sufficient resistance to obtain the low initial speed necessary for getting into mesh, and the other forming a shunt holding on coil. (Two figures.)

6,210/14. **Automatic Telephones.** G. BETULANDER. An addition to No. 29,615/13, describing an automatic telephone system in which all the connections are effected by relays. (Three figures.)

7,884/14. **Insulated Rail-joints.** B. R. WILLS and J. C. SYKES. Joints with enamel insulation, in which the fish-plates, &c., are coated electrolytically or otherwise with pure iron or copper to take the enamel well.

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** ST. HELENS CABLE & RUBBER CO. and WHITE [Wiring] 22,198/13.

**Dynamos, Motors, and Transformers:** PIEPER [Engine-starting motors] 29,504/13; KETCHUM and ANDREWS [Dynamos] 4,344/14.

**Ignition:** DE POORTHER [Sparking plugs] 25,531/13.

**Instruments and Meters:** LEENS [Recording instruments] 25,717/13, and 19,282/14; and [Potentiometers] 19,283/14.

**Switchgear, Fuses, and Fittings:** HOLT and SMITH [Switches] 25,833/13; BERRY [Fuses] 2,301/14.

**Telephony and Telegraphy:** WESTERN ELECTRIC CO. (*Woodward, for W.E. Co., U.S.A.*) [Welded contacts] 26,582/13, and [Selective signalling devices] 26,608/13; VON KRAMER and KAPP [Resonating relays] 27,063/13; GRAHAM [Telephones] 16,839/14.

**Miscellaneous:** NU-LINES MANUFACTURING CO. and CHAPMAN [Electric clocks] 25,184/13; PATTERSON [Miners' lamps] 25,210/13 and 21,968/14; JOSEPH [Sterilisation of water by ozone] 25,503/13; JEFFERSON [Ships' compasses] 103/14; HAMILTON [Pocket lamps] 3,643/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distribution:** HOCHSTADTER [Protective systems] 21,992/14.

**Instruments:** LINCOLN [Wattmeters] 21,792/14.

**Telephony:** OLSON and another [Inductances for multiple telephony] 22,133/14.

**Miscellaneous:** SIGNAL GES. [Sub-aqueous sirens] 7,281/14; GES. FÜR ELECTRO-OSMOSE [Method of influencing the electric charge of a diaphragm] 21,189/14.

### Opposition to Grant of Patents

129/14. **Fire-damp Indicating Device.** A. and L. D. WILLIAMS. Opposition to the grant of this patent has been withdrawn (see ELECTRICAL ENGINEERING, Aug. 6th, p. 446).

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

22,372/00. **Discharging Electrified Material.** J. G. WHITE & CO., LTD., and J. G. WHITE. Means for discharging or neutralising static charges formed on textile material during manufacture.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** W. E. LAKE (*Standard Varnish Works, U.S.A.*) [Insulating compounds] 16,885/08.

**Dynamos, Motors, and Transformers:** SIEMENS BROTHERS & CO., LTD. (*Siemens Schuckertwerke*) [Ventilation of dynamos] 16,300/05; DUPONT and HARLÉ & CIE. [Motor control] 17,137/08.

**Switchgear, Fuses, and Fittings:** M. KALLMANN [Motor control with iron-wire resistors] 16,292/05; J. P. JAKOBSEN and H. F. JENSEN [Switches] 25,551/09.

**Telephony and Telegraphy:** A. POLLAK and G. EGGER [Telegraph perforators] 17,718/02; J. E. KINGSBURY (*Western Electric Co., U.S.A.*) [Telephone transmitters] 17,048/08.

**Miscellaneous:** D. PERRET [Electric clocks] 16,814/04.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A Paper by Mr. A. H. Taylor, published in the *American Physical Review*, describes some investigations into the diurnal and annual variations in overland radio-transmission, leading to conclusions which are summarised as follows:—Overland daylight absorption of electromagnetic waves is several times greater than overseas absorption calculated from the Austin formula. Overland daylight absorption is, unlike overseas absorption, not constant. Overland daylight transmission on long waves is much stronger between Grand Forks and Washington (1,400 miles) in winter than in summer. Overland nocturnal transmission varies with the time of year to a different degree, depending on the nature of the country traversed. The Mississippi Valley shows a very wide variation in summer and winter transmission.

The net traffic receipts of the Pacific Cable Board for the year to March 31st, 1914, exceed those of the previous year by £80,028, and the receipts exceeded expenditure by £21,376. The general expenditure increased by £8,571 due mainly to the installation of an electric lighting and refrigerating plant at Fanning Island.

The Ottoman office notifies that the Bulgarian language is also admitted in telegrams for Turkey.

### ELECTRIC TRACTION NOTES

A description is given in the *Electric Railway Journal* of the equipment of certain lines of the New Michigan and Chicago railway, which is the first 2,400-volt continuous-current line to employ a third rail. The line will be ready for traffic shortly. The third rail is carried on special single-petticoat insulators 8½ in. high. A hole in the base of the insulator fits tightly over a casting screwed to the sleeper, and a similar hole in the top of the insulator takes the clip holding the contact rail. Both the rail and the insulator are held entirely by their own weight. The contact rail is placed 32 in. outside the adjacent track rail and 8½ in. above the track surface, except at turnouts, &c. At crossings an overhead wire is used, as is done in towns and villages. Owing to the position of the contact rail, the shoes project considerably from the side of the cars, and a folding bracket is provided so that they can be drawn in when passing through towns. The longest stretch of line is forty-two miles, and no feeders will be employed other than the 80-lb. low carbon conductor rail. Power will be supplied from both ends, however, as well as through a short cross line at a point about the middle.

## LUNDBERGS' ELECTRIC-LIGHT SWITCHING COMPETITION

(For Initial Announcement, and Particulars of Prizes, etc., see "Electrical Engineering" of Nov. 12th, p. 587.)

### RULES TO BE OBSERVED IN WORKING PAPERS.

1. Three Papers are set: Preliminary, Intermediate and Advanced. Any one of the three papers may be taken, but not more than one. The Preliminary Paper was published in "Electrical Engineering" of Nov. 19th, and the Intermediate Paper on Nov. 26th. The Advanced Paper is given below.
2. Competitors who have passed the Preliminary Grade on a previous occasion must take either the Intermediate or Advanced Grade. Those who have passed the Intermediate Grade must take the Advanced Grade. Those who have passed the Advanced Grade cannot enter.
3. When figure or page numbers are mentioned in the questions, they refer to the booklet "Lektrik Lighting Connections" (new 3rd Edition \*); by the help of which the paper may be worked.
4. Each answer must be done on a separate sheet (or sheets) of paper, on one side only; and each sheet must bear the writer's full name and address. It is not necessary to paste the questions on the answer paper.
5. Each answer must be numbered to correspond with the question.
6. Any competitor who does not wish his own name to appear in the published results should give a *nom-de-plume* or fancy name for this purpose. In all such cases, however, Rule 4 must be adhered to. In the published results only the names (or *noms-de-plume*) and the towns (not full addresses) of successful candidates will be published.
7. Answers to Papers must be addressed to the Editor of "Electrical Engineering," 203, Temple Chambers, London, E.C. Those from competitors living in or near the United Kingdom must reach the Offices of "Electrical Engineering" on or before Jan. 11th next, and the results will be published in "Electrical Engineering" of Feb. 25th, 1915. Answer Papers from far-off competitors must reach the Offices of "Electrical Engineering" by June 1st, 1915, and the results will be announced later.
8. The answer papers sent in will not be returned.

### ADVANCED-GRADE PAPER.

As many as possible of the following twelve questions should be answered.

1. What distinctions (if any) would you make between a Control Diagram, a Circuit Diagram, a Wiring Plan, and a Conduit Plan? Select a single circuit with which to illustrate your answer.
2. Show clearly how the construction of a "Pivot Intermediate" switch can be modified to form various other types of switch.
3. Sketch and describe some form of tumbler-switch control for a small single-phase motor.
4. Select one or more master controls suitable for:—  
(a) a shop, (b) a suite of offices, (c) a house, (d) one other situation.  
Show where the various switches would be placed in each case, and explain how the controls would be used.
5. Show by means of diagrams that the amount of perambulation of a room or other place for the purpose of turning electric lights on or off, in the course of a given period (say three months), is immensely reduced by the substitution of up-to-date controls for single-way controls. Give three examples.
6. Cite any instances that have come to your notice of the deplorable ignorance of the connections and conveniences of modern controls that exists in some quarters. As an example, there was a consulting engineer who objected to the use of "Twinob" switches because of the danger of short-circuiting!!
7. A "three-position" switch with four separate terminals and four fixed contacts has been designed for putting two lamps into series or parallel, and for lighting one only.  
Show what contacts would be interconnected in the up, middle, and down positions of the switch-knob, and also the external connections.  
Show further that this control is useful for heating apparatus.

\* For the convenience of our readers we have arranged to keep a stock of this Booklet and a copy will be sent by return of post on receipt of seven penny stamps. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203, Temple Chambers, London, E.C.

8. A cooking stove is controlled by a series-parallel-and-off switch, and is to be joined-up to one side of a three-wire system. Show that there are two ways of connecting the heating elements to the switch, and that one is in some respects better than the other in the above circumstances.

Which of the two methods would you use on an earthed concentric system of wiring?

9. There are at least four ways in which pilot switches controlling a group of two or more separate heater or other devices may be arranged to operate a single pilot lamp *P*:—

- (a) *P* lights up when any one or more heaters, &c., are switched on.
- (b) *P* glows dimly when one is switched on, and increases in brilliancy as more are put on.
- (c) *P* only lights up when all the heaters in the group are on.
- (d) *P* only lights up when all the heaters in the group are off.

Work out the connections for two groups, with three heaters in each group, for arrangements *a*, *b*, and *d*. Note that the switch for case *d* is different from any of those shown in Fig. 70.

10. Draw plans of the basement, ground, first, and other floors (if any) of a small building of any kind, with outbuildings (if any).

Indicate on the plans the positions of lights, &c. and switches; showing the various controls you would employ. The controls must be selected with discrimination, and the advantages secured by them briefly mentioned.

To simplify the diagrams, the leads to and from the distribution board (or boards) are to be left out, only those wires running between switches and lamps being shown completely. Thus the positive feeds to the switches, and the negative returns from the lamps, &c., may be indicated by short stumps of wire.

Only one kind of small premises must be dealt with; and this may be a house, combined house and shop, small factory, or any other kind of building.

11. In each of a number of vaults with entries at one end only, a single-way switch *S* and two-way switches (without straps) *T*, are fixed as follows:—

L L L L L L L  
ST—T—T—T—T—T

*ST* are fixed at the entry, and *L*, *L*, &c., are lamps or groups of lamps.

The connections are such that, provided *S* be on, each lamp (or group) *L* may be lighted in turn by passing from switch to switch; the moving of any switch-knob lighting the group in front and extinguishing that behind. Thus light may be got at a group on either side of any switch *T*, but not on both sides. Consequently, never more than half the total number of lamps can be on; while generally, if work is proceeding at only one part of the vault, it is only necessary to have one lamp (or group) alight.

Work out the circuit.

12. The large size "Twinob" switch, with the strap connecting two of its terminals cut away, is very suitable for controlling two lamps (or two groups of lamps) fed from different distribution boards.

For example, on a battleship with two separate generating and distributing systems, switch-points arranged as above-described enable light at any given place to be drawn from either or both systems when working, or from one only if the other be disabled.

Sketch the connections of two such switch-points to their lamps and distribution boards, assuming the ship to be "double-wired."

If the ship be "single-wired," show (a) that the "Twinob" switch does not require the above-mentioned alteration, and (b) that a two-way-off switch may be

substituted if it is never required to have both lamps (or groups) on at the same time.

N.B.—Samples of any of the switches, &c., referred to can be supplied to competitors at the average rate of 2s. 6d. each. Requests for samples must be accompanied by remittances, and

must be sent direct to A. P. Lundberg and Sons, Switch Specialists, 477-489 Liverpool Road, London, N. The money will be returned when the samples are sent back in good condition. Mention Competition when ordering. The above is an outside price as regards most switches, and a considerable reduction can generally be made when competitors desire to retain the switches.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### ILLUMINATION OF BUSINESS PREMISES

A BROCHURE full of instructive information, entitled "Scientific Illumination—Its Aid to Business," has been compiled by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.).

In this little work the illuminating engineer has endeavoured to lay before the shopkeeper some arguments and information in a concise form—how essential it is to light his premises on correct lines if he desires to attract customers. The first points to consider in a modern installation are the lay-out of the premises, the class of trade carried on, and the nature of the goods to be displayed. Illumination is measured in

SHOP WINDOWS LIGHTED ON G.E.C. "DALITE" SYSTEM.

foot-candles; it is the business of the illuminating engineer to know how many foot-candles are required to suffuse with light the whole of the premises with its fittings and goods to be displayed. This is done by simple photometric instruments, by which an accurate measurement is obtained for a complete and perfect illumination. The booklet gives a number of illustrations of business premises illuminated by the G.E.C. "Dalite" system, amongst them being Peter Robinson, Ltd., Regent Street, London; and Harrods, Ltd., Brompton Road, London. These will serve as good examples of the methods advocated. The fine effect obtained is shown in the illustration.

### ELECTRIC LIGHT FITTINGS

THE General Electric Co. have also issued a new edition of their "Electric Light Fixtures" Catalogue. Over a hundred pages of new fixtures have been added, and many new designs appear on those pages which in the past were devoted to such accessories as glassware, silk shades, signs, ship fittings, shop lanterns, street lanterns, and posts, which have been eliminated and now appear in separate catalogues. The new edition contains so many new features that it is only possible to call attention to the most important. The pendant section now includes an extensive range of indirect and semi-indirect lighting on what the G.E.C. have named the "Dalite" system of illumination, and a large variety of reflector-bowl and sphere fittings. Many of the fittings in these classes employ "Superlux," "Equiluxo," "Perlux," or "Holophane" glassware, thus ensuring a maximum of efficiency and artistic effect; in other words, the best light and the most of it.

The bracket section includes many new designs based on inverted lights in shades or bowls, a charming example of which is illustrated in Fig. 1. The ceiling fixture and electro-

lier sections contain a number of new fittings based upon a centre light in bowl or sphere, surrounded by a number of smaller units in globes or shades. Many new and original table standards have also been introduced in some adapted Chinese vases such as that illustrated in Fig. 2, which are becoming very popular. There is at the end of the catalogue

FIG. 1.—BRACKET WITH EQUILUXO BOWL FOR SEMI-INDIRECT LIGHTING.

a section devoted to crystal fixtures reminiscent of the Bourbon period. The designs are thoroughly representative and are specially suitable for apartments such as halls, dancing rooms, reception rooms, &c., where illumination is essentially an enrichment of the general decorative scheme

FIG. 2.—CHINESE VASE TABLE STANDARD.

in certain periods. The whole catalogue is extremely well arranged, and the strict sequence of the catalogue numbers is a great convenience. It is interesting to note that, although this catalogue was printed and nearly ready for distribution before the war, it is not subject to any advance in price.

### A DOOR HEATER

A NOVELTY that should be of considerable use has been brought out by the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex, and 123 and 125 Queen Victoria Street, E.C.), in the shape of an electric heater to be attached to the bottom of a door to warm the air

FIG. 1.—EDISWAN DOOR HEATER.

coming in under the door, and thus to avoid cold draughts. This should find application in offices, hotels, railway carriages and ships' saloons, as well as in private houses.

The illustrations show how the heater is fixed to the lower part of the door, either inside or outside the room.

FIG. 2.—GENERAL ARRANGEMENT OF HEATER.

It consists of a radiator parallel to the lower edge of the door, with a flexible wire lead running to a plug on the wainscoting. An automatic switch can be provided to cut off the current when the door is opened. Four "Quartzalite" heating elements are used, each taking 125 watts. The standard measurement is 2 ft. 1 in. overall in length, but modifications to suit special requirements may be had on demand.

### NEW B.T.H. HIGH TENSION SWITCHGEAR

SOME newly-issued descriptive lists from the British Thomson-Houston Co., Ltd. (Rugby), give particulars of some interesting lines of high-tension switchgear developed by the Company. For mining and the rougher style of industrial work, where compact totally-enclosed dust-proof and drip-proof gear is required, a simple and robust type of ironclad "draw-out" gear has been designed in which the oil-switch, instruments (where mounted with the oil-switch), and automatic features are arranged on a sliding carriage and connected to the 'bus-bars or cables through plug contacts. The handles are so interlocked that it is impossible to withdraw or close the isolating contacts unless the switch is in the off position. When the carriage is withdrawn, all the essential pieces of apparatus may be freely examined. The carriages slide on rails, and the gear is so mounted on pedestals that the units can easily be assembled into complete switchboards with enclosed 'bus-bars. The draw-out principle is employed on a larger scale in the ironclad truck pattern of H.T. switchgear, where each complete panel with a flat iron front is carried on a wheeled framework and can be withdrawn bodily from its cubicle like a book from a book-case. This forms an ideal pattern of sub-station gear, and these truck panels are standardised to meet a considerable range of requirements for circuits up to 6,600 volts. Another new list deals with six different varieties of current transformers. Those for the higher voltages, both in the single and multi-turn patterns, all have porcelain tubes between the primary and the secondary. In some cases they are unenclosed, in some cases enclosed in compound, and again another form is oil-insulated. The straight-through patterns are either arranged for slipping the cable through the porcelain tube, or with a fixed copper rod primary.

### AN EXACTING TASK

THE accompanying load curve was voluntarily supplied to the General Electric Co., Ltd. (87 Queen Victoria Street, E.C.), by a large firm whose factories the G.E.C. have equipped electrically. It offers convincing evidence of the remarkable strain which a motor was called upon to withstand. The motor was rated at 50 h.p. at 200 r.p.m., and was driving a pair of heavy crushers. The firm's engineers noticed that at times the motor ammeter needle

LOAD CURVE OF 50 H.P. WITTON MOTOR DRIVING HEAVY CRUSHERS.

swung off the scale, and it was decided to ascertain the extent of the peaks. The result of the investigation is given in the curve. The readings were taken at intervals of five seconds, on moving coil instruments, and it will be seen that overloads of 160 per cent. were attained. The purchaser reported that, during this time, the commutation of the motor was beyond reproach, and, although the average load was above the rating of the motor, it showed no tendency to overheat.

### SHOP LIGHTING

IN our last issue we made reference to a booklet on shop lighting, issued by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), and we reproduced some of the illustrations therefrom, including

examples of both direct and indirect lighting, and showing how great a degree of success has rewarded the work of their illuminating engineers' department. It is also worth while to reproduce the cover design which, executed in blue in the original, is worthy of the contents of the booklet.

## CORRESPONDENCE

SWITCHGEAR CONSTRUCTION COMPANY,  
LIMITED.

To the Editor of ELECTRICAL ENGINEERING.

SIR:—Our notice has been called to the title of the above-mentioned new Company which we understand has recently been formed to take over the Switchgear business of the Union Electric Co., Ltd., and which is now in occupation of Works used until recently by Messrs. Voigt & Haefner (England), Limited. As we consider the title in question so closely resembles that of our Company as to be likely to cause confusion, we beg to inform you that we are in no way connected with the above-mentioned Company, nor, in fact, with any other Company or business concern. We have decided to circularise this letter as the only means of protecting ourselves, since there appears to be no remedy at law enabling us to restrain the Company in question from using the word "Switchgear" as part of its title. Our own title, "Switchgear & Cowans, Limited," was adopted with the object of retaining the identity of "The Switchgear Company, Limited," and "Cowans, Limited," when in 1911 we acquired and amalgamated those two old-established Companies for the purpose of continuing the business of manufacturing electrical switchgear.

Yours faithfully,

SWITCHGEAR & COWANS, LTD.

Springfield Lane, Salford, Manchester,  
28th Nov., 1914.

## APPOINTMENTS AND PERSONAL NOTES

Prof. Eric Gerard, of Liège, has been elected an hon. member of the Institution of Electrical Engineers.

Mr. Walter J. Cridge, for some years past resident in Birmingham, has joined the Queen's Westminster Rifles.

The Northampton Tramways Committee recommend that Mr. J. C. Cameron, the Tramways Electrical Engineer, be appointed Manager for six months to succeed Mr. Gottschalk. The latter, it will be remembered, was recently removed from his position owing to his German birth.

Switchboard attendants are required at Watford and Swindon. (See advertisement on another page.)

Resident engineers, switchboard attendants, shift engineers, &c., are wanted. Particulars are given in our advertising columns.

## EVERY INSTALLATION ENGINEER

Should join his Trade Protection Organisation,  
THE

## ELECTRICAL CONTRACTORS' ASSOCIATION

(Incorporated).

Inquiries cordially invited by the Secretary,

L. G. TATE,

20, Bucklersbury, LONDON, E.C.

## CAPPER PASS &amp; SON, Ltd.,

Bedminster Smelting Works, BRISTOL.

SELLERS OF

ANTIMONIAL LEAD OF ALL GRADES

BUYERS OF

LEAD ASHES & LEAD RESIDUES FROM ACCUMULATORS.

Telegrams: "PASS BRISTOL."

Telephone: 3475 & 3476

TENDERS INVITED AND  
PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Australia.**—The Victorian Government Railways require ten miles of paper-insulated, lead-covered telephone cable. Tenders by Dec. 28th. Further particulars at 78 Basinghall Street, E.C.

The Melbourne City Council requires 6,740 yds. of single-conductor lead-covered copper cable. Specification from Messrs. McIlwraith, McEacharn & Co., Billiter Square Buildings, London, E.C., to whom tenders by Dec. 9th.

**Ireland.**—The Great Northern Rly. Co. (Ireland) require for their Dundalk works electric motors, sub-station switchboard, copper wire, and bitumen wires. Secretary, Dec. 21st. (See an advertisement on another page.)

**London:** L.C.C.—Two 8,000-kw. turbo-generators, with auto-transformers. Dec. 22nd. (See an advertisement on another page.)

**Islington.**—A loan of £4,975 is recommended by the Finance Committee of the L.C.C. for mains, transformers, services, and meters.

**H.M. Office of Works.**—Twelve months' supply of cable and wire from Jan. 1st, 1915. Dec. 7th.

**Manchester.**—Further borrowing powers, amounting to £543,000, are required in connection with the new Barton power-station.

**Oldham.**—An inquiry has been held concerning a loan of £40,000 for electrical extensions.

**Redditch.**—As reported in our columns, a reconstruction scheme at the electricity works, costing £18,000, was decided upon some time ago. Since then, the Birmingham Small Arms Co. has applied for a supply of about 2,000,000 units per annum. Terms have been arranged, and an additional loan of £10,000 is to be applied for.

**Slaitwaite.**—The Yorkshire Electric Power Co. has quoted the Council terms upon which they will be prepared to supply electricity in bulk. It is suggested that a twenty-one years' agreement be entered into with provision for revising the rates at seven and fourteen years respectively. The Company also mentions that, owing to the national crisis, it is not disposed to incur capital expenditure unless absolutely necessary, and suggests that the Council might co-operate by advancing the capital necessary for the mains extensions, the Company repaying by annual instalments with interest during the period of agreement. Mr. J. Schofield has been retained as consulting engineer.

**Stoke-on-Trent.**—A Local Government Board inquiry was held last week concerning a loan of £44,000 for the Electricity Undertaking.

**Tunbridge Wells.**—Two water-tube boilers, with mechanical stokers, economisers, super-heaters, and induced-draught plant are to be installed. Borough Electrical Engineer.

## Wiring

**Fife.**—Electric lighting and telephones, Glen Lomond sanatorium. Architect, A. C. Dewar Leven.

**Glasgow.**—Lighting, telephones, bells, and fire alarms at Robbroyston Hospital. City Electrical Engineer. Dec. 12th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Birmingham.**—Public baths, Sattley.

**Chesterfield.**—Cinematograph theatre, Burlington Street.

**London.**—Reconstruction North-Eastern Hospital. Metropolitan Asylums Board.

**Lowestoft.**—New factory for Messrs. Macdonochie Bros.

**Norwich.**—Extensions to infirmary.

**Nottingham.**—Concert hall, Trent Bridge. Town Clerk.

New building, Notts Co-operative Society (£25,000).

**Penrith.**—Electric lighting of Guardians' premises.

**Rochdale.**—New school. Town Clerk.

**Sheffield.**—New School Medical Department, Sims Street; alterations and extensions at Manor School. City Architect.

## Miscellaneous

**Colchester.**—Three months' supply of electrical goods, from Jan. 1st, 1915, for Severalls Asylum. Clerk, Dec. 10th.

**Edinburgh.**—An electric motor lorry is to be purchased at a cost not exceeding £700.

**London: Port of London Authority.**—Twelve months' supply of arc-lamp carbons. Secretary, Dec. 8th. (See an advertisement on another page.)

### TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**France.**—The Electrical Engineering & Equipment Co. is executing contracts for several thousand miles of telephone cable for the French Government.

**Leeds.**—Some dissatisfaction is being expressed in Leeds owing to the fact that the Corporation has placed an order with Messrs. Escher Wyss & Co., of Zurich, for a 12,000-kw. turbine for the electricity works. Although Messrs. Escher Wyss & Co. are a Swiss firm, the *Leeds Mercury* contends that it is in reality German controlled owing to the connection of the Allgemeine Elektrizitäts Gesellschaft, of Berlin, with the Electro-Bank of Zurich, which is largely interested in the Escher Wyss undertaking. We have communicated with the London representative of Messrs. Escher Wyss & Co., and understand that two-thirds of the Company's capital is held in Switzerland by Swiss interests, and that the A.E.G. has no control whatever.

**London: Hammersmith.**—The following tenders have been received for the supply of high- and low-tension cables of the following sizes:—High-tension, 0'1 and 0'05; low-tension, 0'2, 0'15, 0'1, 0'025, and 7/22 twin: Western Electric Co., £432 10s.; British Insulated & Helsby Cables, Ltd., £440; Callender's Cable & Construction Co., £442 12s.; W. T. Henley's Telegraph Works Co., £442 14s.; Johnson & Phillips, £447 14s.; Siemens Bros. & Co., £453 15s.; Macintosh Cable Co., £454 15s.; and W. T. Glover & Co., £456 13s. The tender of the Macintosh Cable Co. is a firm offer for three months, and it is recommended for acceptance.

**Pontypridd.**—The Council recently advertised for 1,800 yds. of 0'4 sq. in. cable. It was found, however, that none of the English firms were able to undertake to deliver under twelve weeks. As this would be no use for the winter load, it was decided not to put down the new feeder until next summer, but to complete the plating of the sub-station battery instead, the contract for which is in the hands of the Tudor Co.

**Tunbridge Wells.**—The tender of the Western Electric Co. has been accepted for the supply of cables for three years.

**Walsall.**—The Tramways Department has accepted the tender of Siemens Bros. Dynamo Works for a supply of Tantalum lamps.

A curious condition of things was revealed recently in connection with tenders received by a certain Electricity Committee. A firm, thought to be of foreign origin, was asked as to its constitution. They replied that the whole of the capital was held by Germans, the whole of the Board of Directors were German, with the exception of the Managing Director, all the employees were British born, the materials were bought in the open London market, and that a number of their employees had enlisted, and that the Company had decided to pay their dependents during the war.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £58 10s. to £59. (Last week, £58 5s. to £58 15s.)

**Bankruptcy.**—The last day for receiving proofs in the bankruptcy of J. Swainson, Electrical Contractor, 22 Booth Street, Manchester, is Dec. 8th. The trustee is A. Yearsley, 27 Brazenose Street, Manchester.

**Liquidation.**—The statement of accounts in the liquidation of the Leitner Electrical Co. shows liabilities amounting to £31,566 and assets £11,301. The deficiency as regards contributories is £42,263. The Company erected works at Moscow

in 1912 and did a considerable amount of work with the Russian Government. These works, however, are to be closed as the liabilities do not justify their continuance, notwithstanding the amounts due to the Company.

**Canadian Agency.**—An agent in Ontario desires to secure agencies of United Kingdom makers of electric lighting fittings, shades, &c. Further particulars at 73 Basinghall Street, E.C.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Electric Construction Co.**—An interim dividend at the rate of 7 per cent. is to be paid on the preference shares for the half year to Sept. 30th.

**Chloride Electrical Storage Co.**—The directors have decided not to pay an interim dividend on the ordinary shares this year owing to the uncertainty brought about by the war.

### LOCAL NOTES

**Belfast: Administration of Electricity Department.**—Four reports from members of a Special Committee have been prepared, dealing with certain charges made as to the administration of the Electricity Department. They will be considered at a special meeting of the Corporation.

**Manchester: New Power Station.**—It is anticipated that there will be a loss on the Barton power scheme in the year ending March 31st, 1917, of £10,278.

**Mayo: Electric Lighting Loan Refused.**—The Irish Commissioner of Works has refused to sanction a loan for the electric lighting of the Castlebar District Asylum on the ground that it is not an urgent matter, the Treasury having decided not to grant loans in the present crisis except for urgent purposes.

**Peterborough: Street Lighting Tests.**—Tests of experimental metal-filament electric lamps and gas lamps for street lighting, made by Messrs. Alexander Wright & Co., show that the electric lamps gave an average candle-power of 56'86, and the gas lamps 38'88. The electric lamps cost £3 per lamp per annum, and the gas lamps £2 14s., and thus the comparative prices per candle-power per annum work out to 12'7d. for electricity and 16'67d. for gas.

**Portrush: Electrical Installation.**—After deciding to proceed with the electric lighting scheme in accordance with the Order of 1913, the Council has come to the conclusion that the work should be deferred for the present.

**Slaithwaite: Consulting Engineers' Etiquette.**—Mr. A. B. Mountain, Borough Electrical Engineer at Huddersfield, has refused to submit terms in competition with other consulting engineers for giving professional advice to the Council as to an electric lighting scheme. Mr. Mountain informed the Council that this would be contrary to the rules of the Institution of Electrical Engineers.

**Wolverhampton: Electric Vehicles.**—A Paper on electric road transport was read recently before the Engineering Society by Mr. W. E. Warrilow, who pointed out the impetus that had been given to this class of traction by the impressing of petrol vehicles by the War Office and urged the claims of electric omnibuses to link up outlying districts not served by tramways. Mr. S. T. Allen, Borough Electrical Engineer, was in the Chair.

**Yorkshire: Power Co.'s Bill.**—Last year the Yorkshire Electric Power Co. promoted a Bill to enable it to supply electricity in detail in districts where electric lighting powers had not already been granted. Owing to a technical error in the notices, the Bill was not allowed to proceed, but the Company is renewing its application next session.

## SUMMARY

THE testing of power plant with particular reference to boilers and turbo-generators was dealt with in a paper by Mr. W. M. Selvey discussed at last Thursday's meeting of the Institution of Electrical Engineers (p. 628).

SOME particulars are given of the electrically-worked lock gates at Zeebrugge, which were put out of action by the naval bombardment (p. 629).

THE order for a new 5,000 kw. turbo-alternator just put into operation at the Salford Electricity Works was sanctioned by the Electricity Committee ten days after Mr. J. A. Robertson, their new engineer, took up his duties, and the machine was supplied and erected by the British Westinghouse Company in nineteen weeks (p. 629).

COMPLAINT is made at the want of uniformity in the enforcement of the police regulations regarding street and shop lighting during the war. It is suggested that maximum figures of illumination in foot-candles for the two purposes should be specified and that members of the Illuminating Engineering Society should assist the police to enforce them. Mr. Frank Bailey has had trouble due to moisture and condensation in those arc lamps which are not in use, and has to light them in the daytime to dry them out (p. 629).

AMONG the subjects of specifications published at the Patent Office last Thursday are sterilisation of water, welded contacts, car lighting dynamos, and fuses. A patent for the manufacture of insulators has been granted in spite of opposition (p. 630).

THE earthing of lightning conductors is dealt with in our "Questions and Answers" columns (p. 630).

THE action by the Ilford Gas Co. against the Ilford Urban District Council for alleged undue preference in its systems of charging, and also with regard to hiring out apparatus without powers, has been postponed until the next sittings of the Law Courts (p. 631).

IT has been found that the heat developed by 55-watt lamps used as pendants with ordinary shades is sufficient to weaken the insulation of the "flex" at the cord-grip, and also that there may be a similar result in the cases of electric irons, hot plates, &c. (p. 632).

TESTS have been made at the National Physical Laboratory of the carrying capacity of lampholders (p. 632).

SOME further information has reached us with regard to the effect of the war on the electrical industry in Germany (p. 632).

A "WIRELESS SPY" has been sentenced to three months' imprisonment, and another case is proceeding by court martial. Semi-automatic working has been adopted in telephone exchanges at Zürich (p. 632).

REFERENCE is made in "Electric Traction Notes" to the Post Office tube railway and the use of electric cars in America and on the Continent (p. 632).

OUR trade section contains articles describing an electric grinder, an engine revolution indicator, a water-tight lampholder, a new fuse, some combined lampholders and reflectors, and a compact design of switch-board (pp. 633-635).

A 1,000 kw. turbo-alternator is required at Dover; further plant is to be installed at Birmingham; Blackpool (£25,000); Colwyn Bay (£35,000); Coventry (£55,987); Torquay (£15,860); and Turton (£3,560) (p. 635).

DIFFICULTIES are being encountered at Eastbourne through shortness of staff owing to the war.—London borough councils owning electricity works are advised to present individual petitions against the L.C.C. Power Bill. Opposition is also to be offered by West Ham (p. 636).

WE give some particulars of the working of the A.E.G. (Berlin) for the year to June 30th (p. 636).

**Steam Consumption Tests of a Ljungström Turbine.**—In ELECTRICAL ENGINEERING of Oct. 29th, p. 561, we gave some results of steam consumption tests of the 1,000-kw. Ljungström turbo-alternator which has been installed at the St. Pancras Electricity Works. The figures realised, in lbs. of steam per kw.-hr., were 12.75 at full load, 13.57 at three-quarter load, 14.67 at half load, and 17.76 at quarter load. It is of interest to add that the conditions to which these figures refer were as follows:—Vacuum, 28 in.; steam pressure at stop-valve, 185 lb. per sq. in.; superheat, 200° F.

(For arrangements for the week see p. 631.)

## POWER PLANT TESTING

A PAPER on this subject by Mr. W. M. Selvey was discussed at the London meeting of the Institution of Electrical Engineers on Nov. 26th, and will engage the attention of several of the Local Sections. In his introductory remarks, the author made a strong case for the devotion of care and expense to the accurate testing of generating plant, in connection with which the importance of high efficiency was already recognised in the bonus and penalty clause which had become a regular feature of power-plant purchase. Considering first the boiler-house, he showed how the percentage of  $\text{CO}_2$  in the flue gases was an indication of the excess air present and how the efficiency obtainable was expressed in terms of the  $\text{CO}_2$  and the final temperature. The ideal percentage of  $\text{CO}_2$  varied considerably with different classes of coal, but in most English coals was 18 to 19 per cent. He had used the Orsat apparatus for these determinations with an arrangement of aspirator bottles drawing gases from sampling tubes in the flues. For the high temperatures he had used copper-constantan couples supplied by the Cambridge Scientific Instrument Co., Ltd., and checked at the N.P.L. Radiation losses should be not more than 3 per cent. in a 20,000 lb. boiler or 2 per cent. in a 30,000 lb. boiler, and the loss by unburnt fuel could be taken as another 2 per cent. A great deal depended on the suitability of the design of the furnace to the particular class of coal. It is comparatively easy, he continued, to produce an amount of  $\text{CO}_2$  ranging from 12 per cent. to 14 per cent. on a chain grate with a long arch when the duff is not above 30 to 40 per cent; but when this rises above 60 per cent. it is difficult to keep the  $\text{CO}_2$  up to 8 or 9 per cent. To sum up, an average of 10 per cent. would be exceedingly good working. This refers to the gases at the boiler exit. The amount at the economiser exit is often 2 per cent. lower. The size of the economiser has a large effect on the final temperature. The temperatures on full load should taken, say, twenty-four hours after sweeping, and should be used as a standard. If at any subsequent time the boiler exit temperature is found to be  $150^\circ\text{F}$ . higher, or the economiser outlet to be  $100^\circ\text{F}$ . higher, the boiler needs cleaning. Values of  $600^\circ\text{F}$ . for the former and  $350^\circ\text{F}$ . for the latter may be considered satisfactory. The author thought that many engineers were unaware of the average amount of  $\text{CO}_2$  in their boiler houses, and he would be surprised to find if, when taken over the twenty-four hours, it was in many cases anything like as high as 6 per cent.

The use of the Whipple indicator and modern forms of thermometer had enabled an accuracy of nearly 1 per cent. to be reached in turbine testing; highly reliable steam-test gauges were also obtainable. A more difficult measurement was the vacuum at the exhaust flanges, and here an aneroid barometer was preferable to a mercury column. The measurement of condensed matter offered little difficulty, thanks to the manufacturers of weigh-bridges, the accuracy of which was better than 0.1 per cent. With regard to electrical measurement of output, it was better, except for rapidly varying loads, to take precision ammeter and voltmeter readings, rather than trust to watt-hour meters, on account of their temperature errors, and all instruments should be checked where possible *in situ*. Speaking of alternating-current instruments, the author expressed the opinion that the only satisfactory method is to take complete the whole set of pressure transformers, current transformers, leads, and meters, to the National Physical Laboratory—or, say, the Manchester University—before a test, have them thoroughly checked, and then tally every lead on breaking circuit. All the gear should then be brought by hand to the user. The meters should be mounted in a remote-control room quite cool and free from vibration, the length and section of the leads having been pre-arranged to allow for this. With some forms of switchgear, he continued, it is only possible to take the maker's word for the ratio of the transformers, if the testing is to be done "on the system," which it always should be, if possible. The meters alone are then checked. This may give fairly satisfactory results in the hands of an expert if the meters are run on unity power-factor. Efficiency tests should always be run on unity power-factor unless there are serious reasons for the contrary.

The author then dealt generally with air-pumps, and expressed the view that the ultimate type of pump would probably be a steam augments jet in series with a rotary pump of the Kinetic or Leblanc type. In rating air-pumps, provision should be made for 1 to 1.5 lb. of air per 1,000 lb. of steam. The air leakage could be estimated by the Scanes gauge, and it was usual in testing the capacity of air-pumps to disconnect them from the condenser and to admit various

amounts of air measured by the in-draught through calibrated nozzles.

Regarding the testing of cooling-towers, great care should be taken in reading dry and wet bulb temperatures; even radiation from the observer's face is apt to vitiate a reading. After a few remarks on the testing of centrifugal pumps and fans, the author emphasised the importance of careful organisation and choosing of the *personnel*, taking all readings in triplicate, and recommended at least an hour's interval between tests at different loads. He thought that it was fair that turbine plant should run six months on commercial load before being tested, and that the contractor should be allowed forty-eight hours to open out and examine the machine in preparation for the test.

The discussion was opened by Mr. R. A. Chattock (City Electrical Engineer, Birmingham), who said that there was sometimes difficulty in finding the trained observers necessary for accurate tests, especially in small stations. Independent observers were therefore advisable to check the contractors' measurements. Testing was useless unless the test conditions were clearly defined in the specification. There was too much diversity in this respect, and he suggested that the Engineering Standards Committee might take up the question. The testing equipment required might also be standardised.

Mr. C. C. Paterson (National Physical Laboratory), in dealing with the electrical side of the tests, said that an overall accuracy of 1 per cent. meant electrical measurements within 0.1 or 0.2 per cent. This could only be accomplished, in the case of three-phase work with high currents and voltages, by taking great precautions. The two important points were the constancy of the instruments between calibration and testing and the absolute accuracy of the calibration. Modern induction instruments were very little affected by stray fields if certain precautions were taken, but the absolute calibration of three-phase instruments for, say, 1,000 amperes and 600 volts, in making comparisons with standard cells and mercury ohms, could not hope to be accurate unless the most scrupulous care was taken in the arrangements for changing over the circuits. Again, the ratio of current transformers should never be assumed, but the instruments should always be tested complete with their transformers. Three-phase meters should also never be tested on single-phase circuits. It was better to use three single-phase instruments if a three-phase circuit could not be used for testing. Errors had to be guarded against due to interchange of phase connections, but a convention as to this had already been standardised.

Mr. R. Hammond made some amusing remarks on the importance of the money guarantee of efficiency and the necessity of systematic procedure in informing the contractors of the conditions of tests, giving some details of his own procedure in this respect.

Mr. A. E. Scanes (British Westinghouse Co.) showed a slide illustrating his vacuum efficiency and absolute pressure gauge, and joined issue with the author regarding the relative advantage of the steam jet and rotary air pump, strongly defending pumps of the Leblanc class.

Mr. W. B. Woodhouse (Chief Engineer, Yorkshire Electric Power Co.) said that overall efficiency tests were apt to lead to discrepancies, especially in the boiler-house, unless great care was taken as to the assumptions made. It was absurd to base boiler efficiencies on calorimeter tests. In his opinion, the efficiencies of the fuel, the furnace, and the boiler proper should be ascertained separately.

After some remarks by a speaker on cooling tower design, Mr. H. Boot referred to the value of recording instruments in revealing the deterioration of plant, and remarked that the author had not dealt with the V-notch method of water measurement, which he had himself found to give results within  $\frac{1}{4}$  per cent. of the weighing tank system.

Mr. R. S. Whipple (Cambridge Scientific Instrument Co., Ltd.) made a few remarks in favour of electrical thermometers, which in the course of his reply Mr. Selvey characterised as excellent but too expensive.

**International Engineering Congress, 1915.**—A report having recently been circulated to the effect that the International Engineering Congress was to be abandoned, we are desired to state that this is not correct, but that the Congress will be held in San Francisco as intended, from September 20th to 25th, 1915. The Committee of Management is actively proceeding with arrangements, and is in receipt of a sufficient number of communications from various foreign countries throughout the world, including those within the war zone, to indicate that a large majority of the papers originally requested for presentation at the sessions of the Congress will be handed in. Detailed information will be sent upon application to the Secretary, Foxcroft Building, San Francisco, California.

**Royal Institution.**—The Eighty-ninth Christmas Course of Juvenile Lectures will be delivered by Professor C. V. Boys, F.R.S., on "Science in the Home," on Dec. 29th and 31st, and Jan. 5th, 7th, and 9th. The lectures on Jan. 5th will be particularly devoted to electricity in the home.

## ELECTRIC POWER AT ZEEBRUGGE

A REPORT has been published to the effect that one of the reasons that the bombardment of Zeebrugge by our Navy had rendered that place useless as a naval base to the Germans was that the electric power station had been destroyed, and this prevented the opening of the lock gates, so that several German submarines were imprisoned in the inner harbour. It is also reported that the Belgian electrical engineer has escaped to Sluis, and declined the Germans' pressing invitation to return in order to repair the damage.

As so much interest has been displayed in the matter, our readers may like to know some details of the electrical method of working the lock gates. The gates at Zeebrugge are unlike the hinged dock gates more usual in this country; they are of the rolling type, running on rails and disappearing into recesses in the side walls. Each is 67 ft. wide at the bottom and 80 ft. wide at the top, and is carried on two pairs of axles. The total weight of each gate is 200 tons, and they are drawn aside by an arrangement of chains by a winch, driven by a 20-h.p. electric motor. Hand gear is also provided, however, by means of which the gates can be opened or closed by three men in fifteen minutes. Presumably this gear was also put out of action by our shells.

The gates had been working since 1900, having been used by the contractors for some time before the rest of the harbour works had been completed. There was also a very large electric Titan crane, and two electrically-worked swing bridges spanned the lock. All this plant was worked from an electric power station adjoining the lock, which also supplied the local lighting. This was equipped with four water-tube boilers of a Belgian make and two sets of Willans 200-h.p. engines driving continuous-current dynamos, each rated at 350 amperes at 440 volts. The Bruges ship canal, of which this lock is the outlet has a course of  $7\frac{1}{2}$  miles in a straight line, and is 230 ft. wide at the water-line.

It will be seen that Zeebrugge thus formed an excellent base for the assembling and launching of submarines brought by rail.

## QUICK WORK AT SALFORD

TEN days after Mr. J. A. Robertson entered upon his new duties as Borough Electrical Engineer at Salford, the Electricity Committee endorsed his recommendation to accept a tender by the British Westinghouse Co. to supply and erect a 5,000-kw. Westinghouse-Rateau turbo-generator at the electricity works without delay. By suspending Standing Orders, the acceptance of the tender by the Council was speedily effected, and within nineteen weeks of the date of the order the machine was erected and running.

On Mr. Robertson's arrival last May, the generating plant at the works consisted of seven 800-kw. Browett-Lindley vertical engines coupled to Mather & Platt D.C. dynamos, and three 1,000-kw. D.C. turbo sets (two Willans-Siemens and one Willans-Brown Boveri). These sets supplied direct to a low-tension network, including tramways. In addition, power was being brought "in bulk" from the Lancashire Electric Power Co., a three years' contract for 8,000 kw. having been entered into in 1913. This power is supplied at extra high pressure at the boundary of the Lancashire Power Co.'s area and the Borough of Salford, whence an E.H.T. cable leads it to the electricity works, and there it is converted for connection to the D.C. network by static transformers and three 1,000-kw. General Electric rotaries.

As there is no supply of water for condensing purposes at the power house, and cooling towers have to be used, it has yet to be decided whether it will not be expedient to build a new station altogether on another site; but meantime Mr. Robertson decided on the course of putting in a modern 5,000-kw. set, so as to save steam, for the old reciprocating sets are, of course, very uneconomical compared with present-day practice. There is sufficient boiler plant to meet requirements. The new set generates at 6,600 volts, three-phase 50 cycles (1,500 r.p.m.), and to convert to D.C. two Westinghouse 750-kw. rotaries with Westinghouse static transformers (originally destined for a sub-station the buildings for which are not yet completed) have been put down at the works, and the three 1,000-kw. rotaries now used with the Lancashire Power Co.'s bulk supply will also be available. One of the reasons for urgency in getting down the new set was, we believe, that the Power Co.'s supply has been interrupted on one or two occasions. Other sub-stations are also being erected in various positions in the area, and new E.H.T. mains are to be laid and some of the old L.T. mains pulled out. It is not probable that the present contract with the Lancashire Electric Power Co. will be renewed on

expiry, but the main will doubtless be left in as an emergency link between the stations.

Another 5,000-kw. turbo-alternator is on order, to be ready for the winter 1915-16—a Willans (Zoelly)-Westinghouse, the electrical part of which will be an exact duplicate of the present machine. To make room for the latter, one of the reciprocating sets was taken out, and for the second 5,000-kw. set two of these old machines will be replaced.

There was an inaugural ceremony at the works on Wednesday last week, when both Mr. Robertson and the contractors were deservedly complimented on the success of their rapid work. Excellent speeches were made by the Mayor of Salford, the Chairman of the Electricity Committee (Councillor Billington), Mr. Robertson, and others. The speakers were rightly impressed by the contrast in the physical dimensions of the new machine and the old ones compared with their output, and the comparison was well illustrated, as the long line of six large reciprocating sets had almost exactly the same capacity as the compact new set, which was far smaller than one of the six old ones. Moreover, Councillor Billington pointed out that the cost of the old sets had been £14 per kw. against £3 per kw. for the newcomer, which, it was said, consumed  $14\frac{1}{2}$  lb. per kw.-hour as against double the consumption of the old. These figures, needless to say, must be taken as very rough; doubtless something more precise with statements of load, vacuum, and superheat will be available when the reception tests have been taken. Mr. Robertson, after paying a tribute to his staff, whose loyal and energetic co-operation, he said, really deserved the credit given to him, spoke of the field for future development in Salford. At Greenock, whence he had just come, they sold 136 units per annum per head of population, but in Salford so far only 42. There was a large load to be got in Salford, however, with a good diversity factor, and he was hopeful for the prosperity of the undertaking.

## LONDON'S REDUCED LIGHTING

THE reduction in the lighting of the streets of London, and also in the amount allowed in shop-windows, was the subject of a discussion at the Illuminating Engineering Society on Dec. 1st. Mr. L. Gaster, the hon. secretary, complained of the lack of uniformity in the enforcement of the regulations issued by the police. It was suggested that the Council of the Society should make representations to the Home Office on this matter. Mr. Frank Bailey, Chief Engineer to the City of London Electric Lighting Co., gave some interesting particulars of the way the problem has been tackled so far as street lighting is concerned in the City. There the authorities were given definite instructions that the street lamps must not be allowed to illuminate the sides of buildings for more than 6 ft. from the ground. These instructions came at 11.30 in the morning, and all the arrangements were made by lighting-up time the same day. A difficulty arose, however, with regard to dealing with fogs if, as was suggested, the globes of all lamps were to be partly obscured. It was therefore agreed with the City Corporation to leave every alternate lamp clear, but not to light it. This was found, however, to give rise to difficulties due to condensation, rain, &c., and a series of faults developed on these particular lamps through being out of use. The only alternative, therefore, was to dry them out by running them in the daytime, for which, added Mr. Bailey, he had been somewhat severely condemned by those who did not know the circumstances, for wasting current. It is interesting to note that so effective has been the reduction in the lighting in the City of London that officials of the Corporation have been unable, from the dome of St. Paul's, to locate certain points at midnight. A suggestion was made during the discussion that the authorities should lay down a maximum illumination for street lamps and for reflection on the pavements from shop-windows, and that members of the Society should offer themselves to the local police to carry out measurements to see that the regulations are being adhered to. Instances were noted of 16 ft.-candles from a street lamp a few yards away from a shop, the owner of which was summoned for allowing  $1\frac{1}{2}$  ft.-candles upon the pavement outside his shop-window. Among the advantages which the present restricted lighting has conferred would seem to be that for railway goods yards lighting, considerably less illumination than has hitherto been found possible, and particularly has this been the case at the Nine Elms depot of the London & South Western Railway Co. There was a general feeling that when the order for "lights up" is given we should not immediately plunge back to the old lighting, but that experiments should be made with a view to determining to what extent this can be reduced without impairing efficiency. There would seem to be a good many interested in illumination who have come to the view so often expressed by Mr. A. P. Trotter, that the tendency, prior to the war, was towards too brilliant artificial illumination. Mr. F. W. Willcox, of the British Thomson-Houston Co., emphasised the need for scientific shop lighting, pointing out that those firms who had taken expert advice had found themselves much less inconvenienced in the present crisis than shops in which cruder forms of lighting still prevail.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published Dec. 3rd, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

25,503/13. **Sterilisation of Water.** E. L. JOSEPH. Apparatus for sterilising water by ozone, in which the water is forced by a specially designed pump in the form of spray into the space where the ozonised air is admitted, and falls into a settling tank, from near the top of which it is drawn off. (Two figures.)

26,582/13. **Welded Contacts.** WESTERN ELECTRIC CO. (Woodward for W.E. Co., U.S.A.). Machine for affixing contact points of platinum or other metal to switch parts by electric welding. The contact material is fed in the form of wire through a hollow electrode plunger, which welds the point of the wire on to the switch part placed below it. The point is afterwards automatically severed from the wire. (Thirteen figures.)

390/14. **Car-lighting Dynamos.** B.T.-H. Co. and A. A. POLLOCK. An approximately constant voltage is maintained over a considerable range of speed by means of additional field coils excited by the current flowing between an extra intermediate commutator brush and the mid-point of the battery. The extra brush is so placed that the auxiliary field assists the main field at low speeds, and weakens it at high speeds. (Two figures.)

2,301/14. **Fuses.** H. H. BERRY. This is a tubular cartridge fuse in which the internal fuse wire is easily replaced without any tools. The end of the wire is lightly twisted round a pin at the end, and a contact cap is screwed over it with a spring washer, making contact with the fuse wire. The ends of the outside of the tube have screw threads made of coiled wire which assist in making contact. (One figure.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HADLEY [Insulating material] 8,138/14.

**Electrometallurgy and Electrochemistry:** COUCH [Electrolytic cleaning] 23,454/13.

**Heating and Cooking:** BERRY [Ovens] 26,497/13; HEARSON [Control of temperature] 26,831/13.

**Instruments and Meters:** THORPE and THORPE METER SYNDICATE [Electrolytic meters, &c.] 18,869/13; B.T.-H. Co. and YOUNG [Induction meters] 28,826/13; COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATÉRIEL D'USINES A GAZ [A.C. meters] 10,707/14.

**Switchgear, Fuses and Fittings:** TUCKER and CRABTREE [Switches] 23,444/13; ADAMSON [Switches] 25,915/13; GRIESBACH and VENNER TIME SWITCHES, LTD. [Time switches] 27,360/13; ELLISON [Controllers] 925/14.

**Telephony and Telegraphy:** PARSONS [Line selectors] 25,991/13; COMER [Music-transmitting apparatus] 26,077/13; BETULANDER [Automatic telephones] 9,840/14; SQUIER [Wireless receiving apparatus] 17,487/14.

**Traction:** BECK [Automatic control of trains] 25,636/13; ESTÈVE [Car lighting] 133/14.

**Miscellaneous:** A. W. PENROSE & Co. and OWEN [Lifts] 12,659/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Telephony:** ALSSON and ANOTHER [Pupin coils] 22,270/14.

**Switchgear:** BARNUM and ANOTHER [Switches] 22,435/14.

### Applications for Amendment

11,886/13. **Commutators.** C. ZENK. Application has been made to amend this specification by limitation of claims. It describes a method of commutator construction in which the end insulation is moulded out of the assembled segments *in situ*.

### Opposition to Grant of Patents

6,421/13 and 5,501/14. **Insulators.** W. L. DOULTON and P. MORRIS. Grants on these two specifications, which describe machinery for automatically shaping earthenware insulators, has been allowed, in spite of opposition.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** W. SCHMAHL [Junction boxes] 17,511 and 17,512/08.

**Electrochemistry and Electrometallurgy:** H. PAULING [Fixation of nitrogen] 18,435/06; C. GRÜNWARD [Electric furnaces] 7,396/09; P. BUNET and A. BADIN [Fixation of nitrogen] 16,224/09.

**Incandescent Lamps:** C. H. WEBER [Metal filaments] 18,808/09.

**Miscellaneous:** J. C. ETCHells [Lift control] 6,475/09.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,420.

What are the modern methods employed to protect consumers on the L.T. sides of transformers from accident due to high voltage?—"UNIT POLE."

*(Replies must be received not later than first post Thursday, Dec. 17th.)*

### ANSWERS TO No. 1,418.

A small building for storing explosives at a colliery is fitted with two lightning conductors, one at each end of the building. Each conductor terminates in a copper earth-plate, 2 ft. square, packed in coke, and the resistance between the two conductors through the earth was found to be 17 ohms. Is this a satisfactory value?

Discuss the earthing of lightning conductors, and say whether it would be an advantage to connect the two plates together with a copper bond.—"Tyneside."

The first award (10s.) is made to "S. C. J." for a reply given in slightly abbreviated form below:—

Seventeen ohms cannot be said to be a satisfactory value for the resistance between two lightning-conductor earths, especially at this time of the year. The resistance between the two earths should not be more than about 2 ohms, but it is doubtful if such a result can be obtained with plates less than 3 ft. square.

The earthing is a very important part of a lightning-conductor system, and the following points should be observed:—

The conductor leading to the earth plate, and the plate itself, should be of the same metal (preferably copper), or destructive galvanic action will occur at the joint. The joint should be made by means of rivets of the same metal, and should be protected, as far as possible, from moisture. An "earth" consisting of a spiral of copper tape wound on a wood frame with ends leading above ground forms a good "earth," and does away with underground joints. Joints, even above ground, should be avoided as far as possible. The plate should be buried at such a depth as to ensure its being surrounded by permanently moist soil, or arrangements should be made for water to drain into the soil about the earth plate. A quantity of coke or smith's ashes should be buried with the earth plate so as to surround it and help retain moisture. The former is the less satisfactory, because of the larger percentage of sulphur it contains, thus conducing to more rapid corrosion of the plate. In the case of buildings sufficiently large to require two or more conductors and "earths," it is preferable to interconnect the conductors, both along the ridge of the building and also round the base as near ground-level as practicable. The path of a conductor from each point to an "earth" should be as short and straight as practicable. The conductor running round the base of the building should also be used as a means of earthing any masses of metal entering into the construction of the building, in the vicinity of the conductors. In the case of buildings containing explosives, it is preferable to bond the various sections of the rain-water pipes and gutters, and connect same to the lightning-conductor system at several points. Water mains form good earth connections, being more reliable than earth plates. As a general rule, two or more "earths" should be fitted to all conductor systems, one or more of which may be a plate and the others water-main connections. Testing of the "earths" (and indeed the whole of the conductor system) should be carried out at least annually, and preferably at the driest season of the year, so as to ensure that a satisfactory value of "earth" resistance is obtained all the year round.

The second award (5s.) is made to "L. R.," who sends a long reply, from which we have extracted the following for publication:—

Earth plates of lightning conductors must be of sufficient size, must be properly joined to the conductor, and must make a proper earth connection. They are generally of either the plate or tube type. Fig. 1 shows an earth plate *a* of copper or galvanised iron, with connections *b* joined thereto at *c*, as

manufactured by a leading company. A medium standard size is 3 ft. by 3 ft. by 0.032 in. thick. The leads, of stranded and insulated wires, are soldered either at the side or in one corner. An ample joint is provided, the War Office practice being to make the joints of six times the area of the conductors. For inserting the plates in the earth a hole about 6 ft. square is dug. This is provided with a bed 2 ft. thick of crushed charcoal, of sufficient depth to be always damp, and this dampness

must communicate with the main body of water. A further 2 ft. of crushed charcoal is added after the plate is inserted, and the hole is afterwards filled with earth, and plenty of water added. Where natural dampness cannot be reached, some water arrangements must be provided. Fig. 2 shows a tube type, comprising a perforated steel pipe *d* about 2 in. in diameter having a spiked end *f*. Lengths of pipe are connected as the tube is driven down, and the conductor *j* is threaded through the cast-iron projecting top piece, an electrical joint being made by pouring lead into the socket. In order that there shall be permanent dampness, a pipe *j* connects with a gutter *h*, which is placed beneath a rain-water pipe *i*. The construction is completed by a head *e*, which serves to mark the position of the plate. Another tubular form is shown in Fig. 3, and this comprises a tube *m* of about 1 ft. diameter placed in a well, and extending 10 ft. below the water-level in the driest weather. The tube is surrounded by a tube of diameter of about 3 ft. of broken coke, and no mortar or cement is used. Figs. 4-9 illustrate all the earthing arrangements which have been patented in this country from 1884 to the end of 1908. Varley (13,720/88) proposed to provide a network of metal under the basement and round the walls of the building to be protected, this being connected to the conductor and to all the external metal work of the building. Ball (20,726/93), Fig. 4, continues the lightning conductor *b* so that it itself forms the ground plate *g*, it being suitably wound up to effect this. Hedges (19,678/99), Fig. 5, utilises a tube *r* through which the sheathed conductor passes, the tube being packed with carbon and the conductor extending into the cap *v*, which is provided with holes *w*. The conductor is soldered to the head *s*, and the arrangement is completed by an elbow *u* for the supply of water and ring *t*. Immich (23,294/01), Fig. 3, provides two earth plates, *y* and *z*, the first connected to the conductor by the lead 2 and the second to the first by the lead 3. The bottom plate is made of a more electro-positive metal than the top, and is situate always in water. Barland (17,246/06) surrounds earth plates by sawdust saturated with a solution of calcium or magnesium chloride. Highfield (1,947/06), Fig. 7, takes the conductor (5) through an insulating tube (7) into a well (4), and spreads it at the bottom (6). The depth may be 100-200 ft., or until a suitable wet stratum is reached. Ransford (1,995/06), Fig. 8, attaches a lightning conductor to a metal post (8), the base of which fits into a metal socket (9) through a cap (10), the two being secured by the wedge (11), and lugs (12) provided to which a base plate can be attached. Collyer (22,500/06) encases the earth ends (13) of lightning conductors in lead or other good conducting and corrosion-resisting material, such as tapes (14) (Fig. 9). It is desirable to use two separate earth plates, one situate near the surface and the other one deeply buried until continuous water is reached. These two should be electrically connected (see Fig. 6). The reason is that after a heavy spell of dry weather, although the first plate may be almost ineffective, the second acts sufficiently well, but after a sudden heavy downfall the first makes a more efficient earth.

"L. R.," then, replies to the first part of the question, and agrees that the plates are rather small, although he does not consider the resistance of 17 ohms unduly high.

**Preferential Charging at Ilford.**—The action by the Attorney-General (at the instance of the Ilford Gas Co.) against the Ilford Urban District Council with regard to preferential charging and hiring out apparatus was down in the Law List to commence on Tuesday, in the Chancery Division. It has, however, been agreed to postpone the action until the first Tuesday in the next sittings. Mr. Justice Sargant will hear the case.

**Arrangements for the Week.**—(To-day) Thursday, Dec. 10th.—Institution of Electrical Engineers. "Automatic Protective Switchgear for Alternating-Current Systems," by E. B. Wedmore. 8 p.m.—Greenock Electrical Society. "The Electrical Equipment of a Liner," by J. E. Allan.

Friday, Dec. 11th.—Electro-Harmonic Society Smoking Concert. Holborn Restaurant. 8 p.m.

Saturday, Dec. 12th.—Birmingham and District Electric Club, Swan Hotel, New Street. Annual Dinner and Ladies' Night, 7.30 p.m.

Monday, Dec. 14th.—Institution of Electrical Engineers. Newcastle Local Section. At Mining Institute. "Cables," by C. J. Beaver. 7.30 p.m.

Tuesday, Dec. 15th.—Institution of Electrical Engineers. Manchester Section. At Engineers' Club. "Automatic Protective Switchgear for Alternating-Current Systems," by E. B. Wedmore. 7.30 p.m.—Association of Supervising Electricians. St. Bride's Institute, Fleet Street, London. "Wiring Systems," by C. J. Banister. 8 p.m.

Wednesday, Dec. 16th.—Institution of Electrical Engineers. Birmingham Section. At University. Mr. Wedmore's paper will be read. 7.30 p.m.—Royal Microscopical Society. 20 Hanover Square, W. "X-Rays in Relation to Microscopy," by J. E. Barnard. 8 p.m.

Friday, December 18th.—Wireless Society of London. At I.E.E. "High-Frequency Resistance of Wires and Coils," by Prof. G. W. O. Howe. 8 p.m.

### MIND THE "FLEX"

THE necessity of replacing badly-kinked "flex" is more or less obvious to consumers as well as to wiring contractors, but a short Paper by Messrs. S. W. Melsom and H. C. Booth, in the *Journal of the Institution of Electrical Engineers* for Dec. 1st, shows that it is desirable to renew periodically the flex used for ordinary pendants and small heating apparatus before it presents outward and visible signs of deterioration. In experiments made by the authors at the National Physical Laboratory for the Wiring Rules Committee of the Institution, measurements were taken of the rise in temperature of the flex due to the heat arising from pendants with various classes of shades, irrespective of that due to the ordinary C<sup>2</sup>R losses in the wire. In a number of cases the heat from 55-watt lamps sufficed to increase the temperature at the cord grip by 43° F., or about twice the temperature-rise allowed by the Wiring Rules for rubber insulation. Examination of the wire showed that the rubber was practically destroyed, and, in the case of silk-covered wires, the covering was weakened.

Experiments made with a large number of different classes of electrical heating apparatus demonstrated that reliance should not be placed on rubber insulation on connecting wires within the apparatus, except possibly in the case of small radiators. With such things as electric irons and hot-plates the rise in temperature of the flex within 3 or 4 in. of the connection sockets was usually considerably in excess of 30° F., which, assuming the maximum air temperature of the room to be 80° F. and the rise due to C<sup>2</sup>R loss in the wire 10° F., brought the actual temperature to 120° F., the accepted safe temperature limit for rubber. It must not be forgotten, however, that the rise in temperature which destroys the rubber will be sufficient to keep the textile material forming the remaining part of the insulation free of moisture, so that if this is of a nature to withstand the final temperature, no serious trouble need be apprehended.

### THE HEATING OF LAMP HOLDERS

THE results of a series of experiments on the heating of lamp holders, carried out at the National Physical Laboratory for the Engineering Standards Committee, are given in a Paper by Mr. C. C. Paterson, published in the *Journal of the Institution of Electrical Engineers*. The author points out that the maximum number of watts that may be safely transmitted by a screw-socket lamp holder depends on different considerations from those which prevail in the bayonet holder. The limiting factor in the bayonet socket is the gradual weakening of the plunger springs which takes place when the temperature reaches too high a value. The screw socket has no such springs, but connection is made to the lamp-cap terminals by what is equivalent to a clamped contact as the lamp is screwed into place. The general conclusions arrived at as the result of the experiments are that as far as temperature rise is concerned ordinary screw-socket holders may be used for radiator elements up to at least 500 watts each; and that the screw contact is also satisfactory, as at present used, for lamps rated up to at least 1,000 watts, but in the present designs the clamping contacts for the incoming leads become too hot to allow rubber-insulated cables to be brought direct into the sockets without risk of serious deterioration of the rubber.

### THE GERMAN ELECTRICAL INDUSTRY

AN article in the *Zeitschrift für Dampfessel und Maschinenbetrieb* for Nov. 20th, which has reached us via Switzerland, reviews the condition of the German electrical industry at the end of August. In the first weeks of the month no new orders of any magnitude were placed, but towards the end of the month army contracts and other orders increased. Manufacturers of dynamos, motors, and transformers who were not supplying plant for military purposes, however, were generally obliged to work on short time, in some cases only five hours a day. Some of the War Office contractors, on the other hand, found it necessary to work overtime. Makers of other apparatus for electric light and power were seriously affected, and had in some cases to shut down altogether. Installation firms also reported slackness, but installations for military purposes just kept them occupied. Cable-makers and manufacturers of insulating material were also engaged chiefly with Government orders, and although some firms were working full time, others reduced their hours to 60 per cent. Statistics from twelve firms showed that the number of men employed at the end of August was only 9,419, as compared with 15,234 last year—a reduction of nearly 40 per cent.

### ELECTRIC TRACTION NOTES

Referring to the difficulty of obtaining petrol for motor-cars in Germany during the war, the *Zeitschrift für Dampfessel und Maschinenbetrieb* mentions the advantages of electric cars and the large use of them in America. In March this year statistics showed that there were only 3,170 electric cars in Germany, as against 34,075 in America at the end of 1913. The latter figure is actually about half the number of motor-cars in Germany altogether, viz., 78,000. On the other hand, only 3 per cent. of the passenger cars in America are electric, but of the commercial cars, 17,687 out of 77,996 were electrical.

The Annual Report of the Postmaster-General refers to the tube railway being constructed by the Post Office from Paddington to the Eastern District Office in Whitechapel, with intermediate stations at Western Parcels, Western District, and West Central District Offices, and Mount Pleasant, King Edward's Building, and Liverpool Street. The line will be worked electrically, and the tunnel between the stations will be 9 ft. in diameter, and will contain two tracks. The stations will consist of an island platform, in the centre of which electric lifts and conveyors will be provided in order to secure the expeditious transfer of mails between the platforms and the sorting offices. The trains, which will be made up of one, two, or three trucks, will not require drivers, but will be operated by a system of distant control from cabins situated at the stations. It is estimated that the trains will run at an average speed of 25 m.p.h.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

It is stated that two semi-automatic exchanges have been fitted at Zurich, and that under the new arrangements from 600 to 1,000 subscribers are dealt with per operator's position.

The December issue of the *Telegraph and Telephone Journal*, among other interesting items, contains a remarkable personal description of the last work of operators in the Antwerp Central Telegraph Office, and their flight at the fall of that city; and some experiences of a British engineer officer on active service.

The sentence imposed by Court Martial upon the German named Harold Fochtenberger, for having a wireless telegraph apparatus at Thorpe Bay, is three months' detention. The original sentence was six months with hard labour, but this was subsequently reduced. We gave particulars of the charge against the prisoner in *ELECTRICAL ENGINEERING*, Nov. 12th, p. 590, and Nov. 19th, p. 600.

A Court Martial has also been held at Hull with regard to a charge against A. G. Cox, Bungalow Aerodrome, Filey, for having a wireless apparatus in his possession. It was stated that prisoner was British-born, and is the travelling representative of a Wolverhampton engineering firm, and that he used the wireless apparatus for lecturing to Boy Scouts. A representative of the General Post Office stated that the apparatus could transmit to a distance of five miles. The decision of the Court will be announced in due course.

The *Wireless World*, in some interesting notes on wireless and the war, attributes the German Navy's knowledge of the movements of our ships in the Pacific, which led to the action off the Chilean coast, to the presence of a number of wireless stations in the neighbourhood manned by German operators. It is stated that these stations were equipped under cost price by a German company, and provided with such complicated receiving apparatus that the German operators sent out to erect them had to be retained, so that in this way the German Intelligence Department obtained a valuable secret "Imperial wireless chain." The remedy suggested is the adoption by British ships when communicating with one another of a "Bridge" transmitter, which has only a short range, so as not to be overheard.

The Netherlands Indies Administration state that they authorise the use of Dutch, Malay, German, and English in plain language telegrams.—The cable between Australia and New Caledonia has been restored.—The Mole St. Nicholas-Port-au-Prince cable is down. Telegrams for the latter place are sent by land-lines of the Haitian Republic at the same rates as for "other places" in Hayti.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### AN ELECTRIC HAND GRINDING MACHINE

A VERY serviceable form of electric hand grinding machine has just been placed on the market by Morris & Lister (London) Ltd. (3 and 4 Palace Chambers, Bridge Street, Westminster, S.W.). This machine, which is especially suitable for use in foundries, is provided with long hand grips, fixed at the ends in line with the shaft of the motor, thus enabling the machine to be handled with the greatest facility owing to the good distribution of weight. The arrangement of the handles also ensures that the grinding wheel is not interfered with in whatever position it might be desired to use the machine. The machine can

ELECTRIC HAND GRINDER.

be used for finishing up castings of any shape, and in many cases enables rough filing to be entirely done away with. The weight is only 13 lbs. with a  $\frac{1}{4}$ -h.p. motor, and this size machine is capable of being used with an emery wheel up to 4 in. diameter by  $\frac{1}{2}$  in. in width. Both D.C. and three-phase machines are obtainable, the former being adapted to run at a speed of 2,400-4,000 r.p.m. and the latter at a speed of 2,400-2,800 r.p.m. The motor of the D.C. machine is a  $\frac{1}{4}$  h.p. and that of the three-phase machine  $\frac{3}{4}$  h.p. The machine is of neat appearance and solid construction, and the price has been kept as low as possible. Such a machine should be very useful as a means of replacing hand filing and grinding generally in works operations.

### AN ENGINE REVOLUTION TELL-TALE

A NEW instrument has been placed on the market by Siemens Bros. & Co., Ltd. (Woolwich), for indicating the revolutions of marine engines electrically without the use of rubbing contacts. The transmitter, placed near the engine shaft (Fig. 1), consists of an electromagnet provided with two windings, one of which is connected to the lighting supply of the ship, whilst the other is connected to the indicator (Fig. 2). An iron armature fixed to the shaft

FIG. 1.—TRANSMITTER.

FIG. 2.—INDICATOR.

passes, during each revolution, the poles of the electro-magnet, thereby inducing a current in the second winding which actuates a small flag in the indicator, moving it across a window at each revolution of the shaft. There are two flags and windows on the indicator, one for each direction of

rotation of the shaft, and a two-way switch is provided which is actuated by the reversing gear, and connects either the one or the other winding of the indicator, depending on the direction of rotation of the shaft.

The indicator is provided with a lamp for illuminating the windows for night-work, and the flag and window project in a semicircular shape, so as to be more easily seen from the side. A switch is provided to disconnect the mechanism when not required. Each part is contained in gun-metal water-tight cases, and is strongly constructed.

### A WATERTIGHT LAMPHOLDER

A NEW pattern of watertight lampholder, constructed of galvanised steel, has been brought out by Simplex Conduits, Ltd. (116, Charing Cross Road, W.C.). As will be seen in the illustration, the holder is provided with a drainage lip, which effectively carries the drip water clear of the lampholder shell; the length of thread has been increased to about  $\frac{5}{8}$  in., and on the shade carrier pattern a

GALVANISED WATERTIGHT LAMPHOLDER.

sensible method of attaching the shade has been incorporated. This holder is particularly suitable for use in exposed situations, such as factories, yards, subways, station platforms, outside lighting installations, etc., and will resist the attacks of impurities in the atmosphere, which quickly make the ordinary brass lampholder corrode.

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**RADIATORS.**—A new list of radiators and other heaters has been issued by the Edison & Swan United Electric Light Co., Ltd., in which a general revision of prices is noticeable on account of the changes in the cost of raw material. Several new patterns are included. The types of heater dealt with comprise "Quartzalite" heaters of the latest type, lamp radiators, non-luminous convectors, combined radiators and convectors, and hot bar radiators.

**RADIATOR LAMPS.**—A leaflet from the Stearn Electric Lamp Co., Ltd. (47 Victoria Street, S.W.), deals with Stearn radiator lamps. These are now supplied in the usual 250-watt size, with either bayonet or Edison screw caps. In the latter case, the brass collar is insulated from the Edison screw, making the lamp shockproof.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**TIME SWITCHES.**—A list of a large number of patterns of time switches and sign flashers is to hand from W. Geipel & Co. (Vulcan Works, St. Thomas Street, S.E.). The former range in capacity from  $1\frac{1}{2}$  to 250 amperes, and include a special form for staircase or corridor lighting. Two distinct types of time switch are dealt with, the first arranged for switching on by hand and off automatically, and suitable for the restricted hour or two rate system, while the second switches both on and off automatically, and is used for street lighting, signs, &c.

**BOILER FITTINGS.**—A catalogue from the sales department of the National Boiler and General Insurance Co., Ltd. (National Buildings, St. Mary's Parsonage, Manchester), deals with such boiler fittings as fusible plugs, safety valves, hydraulic test pumps, indicator and testing cocks, salinometers and alkalinity testing apparatus, plate gauges, test drills, pressure gauges, water gauges, thermometers, and various accessories for engine and boiler testing.

### THE "FLUVENT" FUSE

WE have received from Parmiter, Hope & Sugden, Ltd. (Hulme Electrical Works, Manchester), particulars of the porcelain tube fuses which they manufacture on their patent "Fluvent" system. The "Fluvent" fuse is a tubular fuse, having the fuse wire placed diagonally across the tube instead of straight down it. The wire passes through small holes from one contact to the other, the contacts being placed at the sides instead of at the ends of the tube, preventing any tendency to arc from contact to contact. When the fuse is in position, the fuse wire being arranged obliquely across the tube, the blow-out effect of the tube tends to blow the arc away from the contacts instead of towards them. It

"FLUVENT" FUSE CARRIER.

will be seen that by this arrangement it is possible to have a fuse with a very short break, and consequently the running temperature of the fuse is low, and the usual trouble from ageing of copper fuses through oxidation is avoided. The size of wire to fuse at various currents is printed on the back of each fuse, as seen in the illustration. The sockets for these fuses are of very convenient shape for ready insertion of the fuse-carrier into the contact clips, but the contacts are nevertheless readily accessible for inspection and adjustment, owing to an extremely ingenious method of mounting up for distribution boards. The reduction in size compared with boards of the ordinary works type is enormous. A pamphlet issued by the firm gives particulars of some interesting experiments carried out by Mr. S. L. Pearce, of the Manchester Electricity Works, on the wonderfully efficient behaviour of the fuse on short-circuit and in breaking circuits of large inductance.

### COMBINED REFLECTORS AND LAMPHOLDERS

AMONG the items in the new season's catalogue just issued by the Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.) are the steel reflectors complete with holders illustrated in Fig. 1. The holder is of their well-known

FIG. 1.—COMBINED LAMP-HOLDER AND REFLECTOR.

"Benco" weather-proof china insulated type, fitted in some cases with lever switch, as shown in Fig. 2. The steel shades are also a well-known speciality of the firm, with a special easily cleaned reflecting surface. An extensive variety of both lamp-holders and shades are listed, and a novelty appearing for the first time is the steel reflector

with concentrically fluted surface, shown in Fig. 3. We understand that these have been employed with great success

FIG. 2.—BENCO HOLDER WITH SWITCH.

FIG. 3.—CONCENTRICALLY FLUTED REFLECTOR.

in the lighting of textile mills, and are eminently suitable for use with traction lamps. There are many other items, including wireless cluster bodies, trough reflectors, electric horns, and the well-known Benjamin friction driven screw-drivers, and useful sets of tools on the same principle—and the list is of special interest in view of the present demand for British-made goods.

### A COMPACT SWITCHBOARD

ONE of the most troublesome restrictions in switchgear design is lack of space. A recent example of a large amount of switchgear compressed within small dimensions is illustrated here. This is a boiler-plate cubicle for alternating-current work supplied by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), to an important firm in the Midlands, for whose works they are undertaking the complete electrical equipment. This and a sister board had to be placed in a very cramped position; the dimensions were so small that two panels had to be mounted directly over each other. Being composed of boiler-plate cubicles it was necessary to

BOILER-PLATE SWITCHBOARD SPECIALLY DESIGNED FOR COMPACTNESS.

provide inspection-doors, which gave not only a good view of the interior but enabled work to be carried out inside the board should it become necessary. A number of doors are provided for this purpose, and several had to be utilised to accommodate the instruments. In the interior, too, the whole of the gear had to be compressed, and this has been accomplished without any material reduction in the factor of safety. It is of interest to note that the whole of this board throughout is of G.E.C. construction, including the switches, instruments, instrument transformers, fuses, tumbler switches, and so forth.

## AN ATTRACTIVE SHOWCARD

OUR readers will all have admired the General Electric Co.'s bold and vigorous Osram lamp design on our front cover this week. It is impossible, however, to do full justice in monochrome to the artistic merit of the original from which it is reproduced. This takes the form of a new show-card printed in ten colours, just produced by the Company, which happily combines bold colouring, harmonious design, and a commanding appeal to the eye, worthy of the quality of the British-made lamps to which it calls attention.

## CORRESPONDENCE

## LAMP WORKS AND THE ADMIRALTY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The Lemington Glass Works, which are principally engaged in manufacturing bulbs for the "Osram" and "Robertson" lamps, have been heavily taxed since the outbreak of war by urgent Government orders. In addition to the seventy-four men who have enlisted from the lamp works, a very large number of men have left the glass works to join the Army. The martial spirit among the men is very great, and in this connection a very large number of bulb-blowers having expressed their desire to join the Army, the Admiralty were informed that this might entail delay with their work, and the result has been a communication from the First Lord of the Admiralty to the employees of the Lemington Glass Works to the following effect:—

"Admiralty, Whitehall, S.W.,  
"December 5th, 1914.

"I wish to impress upon those employed by your establishment the importance of the Government work upon which they are engaged. I fully appreciate the efforts which the employees are making, and the quality of the work turned out, and I trust that everything will be done to assist the Naval Authorities by pushing on all orders as rapidly as possible. I should like all engaged by your establishment to know that it is fully recognised that in carrying out the great work of providing for the requirements of the Royal Navy, they are doing their duty for their King and country equally with those who have joined H.M. Forces for active service afloat or ashore.

"(Signed) WINSTON S. CHURCHILL."  
Yours faithfully,  
OSRAM LAMP WORKS, LTD.  
(C. Wilson.)

Brook Green, Hammersmith, W.

## SHOP LIGHTING.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Owing to the police regulations, the subject of shop-window lighting has received more attention recently than it has ever done. A walk down any of our leading shopping thoroughfares on any evening will be rewarded by the sight of many amateurish attempts at light diminution. A much favoured method is the fixing of tissue paper shades round bare lamps; this is not only ineffective from an illumination standpoint, but is a distinct source of danger, as witnessed by the large amount of badly scorched tissue paper seen. As a result of the lack of illuminating knowledge, the results achieved are, more often than not, gained at the expense of practically the total sales-value of the show window itself. Yet it is quite possible to light a window in such a way as to ensure a brilliant light on the goods and, at the same time, avoid glare on the pavement.

The British Thomson-Houston Co., Ltd., have, as you know, had a large amount of experience in shop lighting, both for the inside of the shop and for the show window. Those of our customers who installed concealed lighting before the war have had cause to congratulate themselves since the war, as they have been called upon to make few, if any, alterations in their lighting arrangements.

It is with a desire to assist your readers that I am writing this letter to inform them that they can call upon our illuminating engineers for free advice as to the lighting of windows in an efficient and approved manner.

Yours very truly,

F. W. WILLCOX,

General Manager, Lamp and Wiring Supplies Dept.

Mazda House,

77 Upper Thames Street, E.C.  
Dec. 4th, 1914.

## TRADING WITH THE ENEMY.

Mr. T. W. Cole writes us that contracts between British subjects and corporations and alien enemies involving quite a colossal amount in the aggregate, are being held up pending definite legislation as to whether they can be deemed to be cancelled or suspended. He emphasises the desirability of such legislation as soon as possible to enable these contracts to be transferred to British firms, and to give employment to British labour.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Birmingham.**—Owing to the abnormal requirements of the city for electric power purposes, the Electric Supply Committee has held a special meeting to consider the question of installing further generating plant.

**Blackpool.**—The Electricity Committee has appointed a deputation to inspect modern types of boilers. Extensions estimated to cost £25,000 are contemplated, and the Committee requires the most up-to-date boiler plant available. Tenders for certain portions of the work have been accepted and are referred to in another column.

**Colwyn Bay.**—A loan of £35,000 for the construction of a new power station in conjunction with a refuse destructor is to be applied for. It is intended to instal a 1,500-kw. 6,000-volt turbo-alternator which will transmit power to the existing power station, where it will be transformed down.

**Coventry.**—A loan of £55,897 is to be applied for in connection with new plant and buildings at the power station. The present demand practically exhausts the whole of the steam-raising capacity, and in view of the fact that so many firms are putting down additional plant for which the Corporation will be called upon to supply the necessary electrical energy for driving, it has been decided to instal four new boilers each capable of evaporating 30,000 lb. of steam per hour with the necessary generating plant.

**Dover.**—It is proposed to instal a 1,000-kw. turbo-alternator.

**Torquay.**—The L.G.B. has sanctioned a loan of £15,860 for extensions to the electricity undertaking. Of this £13,000 is for new plant and machinery and the remainder for buildings.

**Turton.**—Sanction has been received to a loan of £3,560 for prospective expenditure on mains, services, and meters.

## Wiring

**Exeter.**—Sanatorium.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Blackburn.**—New fire station.

**Chester.**—New elementary school.

**Crewe.**—Offices for Prudential Assurance Co.

**Devonport.**—New elementary school.

**Hanwell.**—Isolation hospital (£5,000).

**London: Islington.**—New free library.

**L.C.C.**—New North-Western Polytechnic.

**Preston.**—Baths in Walker Street.

**Salford.**—Hospital at Nab Top Farm, Marple (£27,000).  
Town Clerk.

**West Bromwich.**—New post office. H.M. Office of Works,  
London.

## Miscellaneous

**Leeds.**—A twelve months' supply of electrical stores is required by the Garforth Colliery Co. Dec. 24th.

## TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Blackpool.**—The following tenders have been accepted:—1,500-kw. turbo-alternator, British Thomson-Houston Co.; surface-condensing plant, Cole, Marchant & Morley; L.T. cable, W. T. Glover & Co.; H.T. cable and copper trolley wire, British Insulated & Helsby Cables; iron switch fuse pillars, Sykes & Sugden.

**Dublin.**—The Electric Supply Committee reports that, having been compelled to cancel a contract with a Nuremberg firm for arc-lamp carbons, it has purchased at an increased cost 2,000 pairs of carbons from the London Continental Stores Co., which made the lowest offer for early delivery.

**London.**—The Tower Cinema Picture Theatre, recently opened at Peckham, is fitted throughout with Pope "Elasta" wire lamps, some 2,500 lamps being installed.

The General Electric Co. has again been successful in securing a twelve months' contract for the supply of Osram shiplighting lamps from the Cunard Steamship Co., Ltd.

**Manchester.**—Contracts for cable have been placed with British Insulated & Helsby Cables and the Macintosh Cable Co.

**Tunbridge Wells.**—The Corporation have adopted a recommendation for additional heating at the sanatorium by electricity. This is to be carried out by the "Hestia" type of radiator, the installation having a total capacity of 24 kw.

## APPOINTMENTS AND PERSONAL NOTES

Mr. T. A. Edison has been elected an Honorary Member of the Illuminating Engineering Society, "for services rendered to the cause of illumination."

A lighting superintendent, under the control of the Chief Electrical Engineer, is to be appointed at Dublin, at a salary of £200 rising to £300 per annum.

Mr. Duncan Watson has taken over the Chairmanship of the Marylebone Electricity Committee.

Mr. Wright has been appointed mains assistant in the Dover electricity undertaking, at a salary of £117 per annum.

An assistant electrical engineer is required by the Croydon Corporation. Salary £250 rising to £350 per annum. Dec. 17th. Town Clerk.

A charge engineer, two junior engineers, and four switchboard attendants are required at Bolton. Borough Electrical Engineer.

A junior assistant is required in the Ventnor electricity works.—A sub-station attendant is required in the Ipswich electricity works.—Temporary switchboard attendants are required for L.C.C. Tramway sub-stations. (See advertisements on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £58 10s. to £59 (last week the same).

**Liquidations.**—A meeting of the Jandus Arc Lamp (Continental Patents) & Electric Co., in voluntary liquidation, will be held at Messrs. A. Gillies & Co., 40 Brown Street, Manchester, at 12.30 p.m., on Dec. 30, to hear the liquidator's account of the winding-up.

**Change of Address.**—The offices of Rushmore Lamps, Ltd., have been transferred to their works at 26A Peterborough Road, Parsons Green, Fulham, S.W. (Telephone: Putney 2490 and 2491; Telegrams: Aplanatic Ful.).

**Italian Agency.**—An Italian agent desires to secure the representation of United Kingdom manufacturers of electric lamps and apparatus. The name and address is on file at 73 Basinghall Street, E.C.

## LOCAL NOTES

**Arbroath: Electricity Works Assessment.**—The appeal recently reported in these columns of the Arbroath Electric Light & Power Co. against the assessment of their works at £1,215 came before the Land Valuation Appeal Court last week. The argument is that the proper basis of assessment is to take the average of the previous three years, and not the figure for the previous twelve months. It was asked that £500 should be the figure, but the Court by a majority,

and, of course, without giving reasons, fixed the figure at £1,100.

**Eastbourne: Difficulties through Enlistment.**—The Borough Electrical Engineer having reported that owing to the number of men from his staff who have enlisted, he will find it difficult to keep the works going if others follow suit, it has been decided that members of the electricity staff desiring to enlist shall obtain the consent of the Committee before doing so.

**India: Ventilation.**—According to the *Indiaman*, Mr. J. W. Meares, the electrical adviser to the Government, has devised a system of forcing artificially cooled air through hollow walls for keeping premises cool. Tests will be carried out at the new Chief Court at Lahore, and a house similarly constructed is to be erected in the new Delhi.

**London: Islington: Electric Power Scheme.**—Mr. A. Gay, Borough Electrical Engineer, has reported, after having attended a conference of London local authorities at the Shoreditch Town Hall, that it was decided to recommend all the London boroughs owning electricity undertakings to present individual petitions against the London County Council Power Bill.

**Pontypridd: Bulk Supply.**—The Borough Electrical Engineer has reported that certain conditions in the proposed agreement with the South Wales Electrical Power Distribution Co. for a bulk supply are quite unacceptable. Among these he specifies the clause by which the Council would have to take a supply for a long number of years, and to pay a minimum amount of £150 per annum. This supply is only for an outlying portion of the Council's district.

**West Ham: The London Power Scheme.**—The London County Council power scheme was the subject of a prolonged discussion at the last meeting of the Corporation, during the course of which Alderman White said he had information to the effect that the London County Council proposed to drop West Ham out of the scheme altogether. Alderman Littler, Chairman of the Electricity Committee, said he was not aware of this. One point which the Electricity Committee are considerably apprehensive about is that the L.C.C., although taking powers to supply in bulk by agreement to existing authorities, also take compulsory powers to supply to docks, railways, &c. At the present time West Ham supplies some millions of units annually to the Port of London Authority, and naturally resent any competition of the sort foreshadowed in the L.C.C. Bill for this supply.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Allgemeine Elektrizitäts Gesellschaft.**—Reference is made in the Swiss papers to the report of the A.E.G. for the half year ended 30th June, 1914. This, of course, covers a period before the war broke out, and the profits were sufficient to allow of a dividend equal to that of the previous years, i.e., 14 per cent. On account, however, of the uncertainty of the situation and the losses bound to occur in respect of both the company's home and foreign trade a dividend of only 10 per cent. was finally declared.

**Aron Electricity Meter.**—The directors have announced that it is not their intention to pay an interim dividend on the preference shares.

**The British Westinghouse Co. and the War.**—In our issue of Sept. 10th, p. 496, we mentioned how the British Westinghouse Co. was encouraging all its eligible employees to join the Forces. We now understand that 1,046 men have joined, and we regret to hear that two have already been killed at the front. It is also interesting to note that the aviator Sippe, who was one of the three to throw bombs on the German airship hangars at Dusseldorf, is an ex-Westinghouse man. The Company is dealing with 422 cases of dependents per week, and there is a standby fund which amounted to £1,705 at the beginning of November. Two rifle ranges have been erected in the works grounds for the use of those not eligible to join the Forces.

**The Sales Managers' Association.**—At a meeting of this Association at the Holborn Restaurant on Thursday, Dec. 17th, at 8 p.m., Mr. H. Scholey will open a discussion on the position of the British electrical industry and methods of extension in the markets of the world. A number of prominent electrical engineers are expected to be present. Those desirous of attending are invited to communicate at once with the hon. secretary of the Association, Mr. F. R. Jones, Sardinia House, Kingsway, who will be pleased to supply particulars and send an invitation.

## SUMMARY

ADDITIONAL regulations have been issued for still further reducing the amount of lighting in the streets of London. Rear lights are also compulsory upon all vehicles (p. 637).

THE relative advantages of the various systems of automatic feeder and machine protection were discussed at the Institution of Electrical Engineers last Thursday. Mr. Wedmore, the reader of the Paper, preferred the split conductor method for ordinary feeders, the "core-balancing" system for tail-ended feeders, and the Merz-Price system for generators, etc. (p. 638).

THE interruption of supply to the L.C.C. Tramways on Friday afternoon was due to a fire on the wooden staging erected in connection with switchboard extensions at the Greenwich Generating Station. This fire was caused by the failure of an old instrument transformer, and all the generator cables became involved in it (p. 639).

A FEW modifications are suggested by the Parliamentary Committee of the L.C.C. in the Draft Bill dealing with electricity supply. An important one is that, assuming no agreement can be come to with a leasing company, the new Authority shall retain the proposed control over the existing Supply Authorities in the scheduled area (p. 639).

THE principles, design, and use of static balancers are dealt with in our "Questions and Answers" columns (p. 640).

AN electrolytic cleaning machine, an electric oven,

an alternating current meter, and a magneto hand lamp are described in specifications published at the Patent Office last Thursday. They also include a Betulander telephone patent and that for the Squier "wired wireless" telegraph system. Application has been made to revoke one of the patents for the "Brolt" car lighting system. A B.T.-H. patent for inverted rotary converter control expires this week after a full life of fourteen years (p. 641).

RECENT telegraph and telephone progress in this country is reviewed in the Postmaster-General's annual report. A few details are given of the Marconi Wireless Telephone (p. 642).

OUR trade section contains descriptions of a luminous helm indicator, an electric sign, an alternator regulator, and a metal-filament traction lamp (p. 643).

LEGAL proceedings are again threatened by the Sheffield electrical contractors against the Corporation with regard to the Wiring Department.—Competition between the Electricity and Gas Departments at Bolton is complained of.—The street lighting at Southport is to be considerably curtailed owing to shortage of carbons (p. 644).

A LOAN of £30,000 is to be taken up at Greenock; £2,100 at Weymouth; £1,350 at Newcastle-under-Lyme; £675 at Altrincham; and £273 at Middleton.—Rotary-converters and cables are required at Wednesbury and transformers at Bacup (p. 645).

**Arrangements for the Week.**—(To-day) Thursday, Dec. 17th. Institution of Electrical Engineers, Yorkshire Section. At Hotel Metropole, Leeds. Sir John Snell (President) will attend. Resumed discussion on Mr. Selvey's Paper on "Power Plant Testing." 7.15 p.m.

Friday, Dec. 18th.—Institution of Mechanical Engineers. Five Papers on "Audible and Other Cab Signals on British Railways." 8 p.m. Wireless Society of London. "High Frequency Resistance of Wires and Coils," by Prof. G. W. O. Howe. 8 p.m.

Saturday, Dec. 19th.—Association of Mining Electrical Engineers. West of Scotland Branch. At Royal Technical College, Glasgow. "Experience of Surface Earthing in Scottish Mines," by P. S. Glover. 4.30 p.m.

Monday, Dec. 21st.—Institution of P.O. Electrical Engineers at Institution of Electrical Engineers, Victoria Embankment. "Power Circuit Interference with Telegraphs and Telephones," by S. C. Bartholomew.

**Darker London.**—The police authorities in the Metropolitan area have issued further instructions with regard to lighting in the streets, and have now prohibited all lights outside shops. Hitherto the shop-lighting prohibition has been limited to "powerful" lamps, but there has been doubt as to what this exactly meant. Another regulation imposes upon all vehicles the necessity for a rear light. We welcome this much needed requisition, and trust that it will not merely be a temporary measure, but that after the war it will be made a permanent one.

**Northampton Polytechnic Institute.**—At the annual prize distribution and students' conversation last Friday, the prizes and certificates were presented by Lord Moulton, of Bank. The proceedings opened with an organ recital, and the laboratories and workshops of the various departments were open to inspection.

## AUTOMATIC PROTECTIVE SWITCHGEAR

AT the Institution of Electrical Engineers on Thursday, Mr. E. B. Wedmore read a Paper reviewing the various methods of feeder and machine protection on alternating-current systems. For the protection of ordinary feeders, he recommended the "split conductor" system, described fully in *ELECTRICAL ENGINEERING* of Oct. 22nd, 1914. The type of three-core cable, in which each core is divided into two oval-shaped concentric conductors, separated by a comparatively light insulation (Fig. 1 in the article referred to), cost, he said, only slightly more than the standard pattern. In

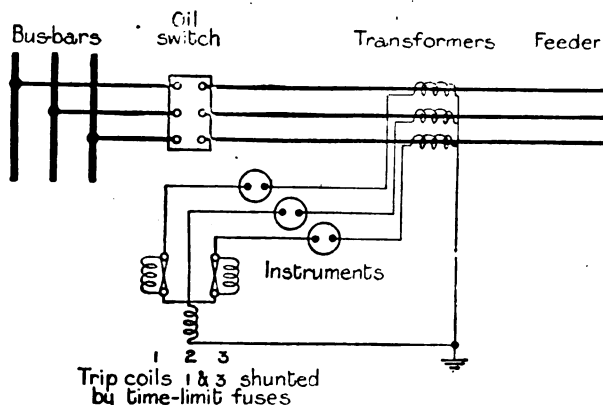

FIG. 1.—CORE-BALANCING COMBINED WITH OVERLOAD PROTECTION.

the case of overhead feeders, the two "splits" are carried on the same insulators in adjoining grooves.

For what the author called "open-ended" feeders—more clearly expressed by the term "tail-ended," which Mr. Clothier employed in the discussion—and also individual motor circuits, isolated transformers, rotary converters, &c., he recommended the "core-balancing" system of protection, which is a development of the method described by Mr. M. B. Field in *ELECTRICAL ENGINEERING* of July 1st, 1909. In the original system, a ring transformer, or rather a ring-

FIG. 2.—SOURCE OF SUPPLY PROTECTED BY CORE-BALANCING.

transformer core with one winding which acted as the secondary, was placed over the three feeders and connected to a relay. Normally the currents induced in the secondary by the three phases neutralise one another, but, if a fault occurs in one phase, this no longer obtains, and the relay is operated and closes the circuit of the trip coil of the main switch. Fig. 1 shows the application of this to combine it with overload protection, by using three ordinary current transformers instead of the ring transformer. A modification

FIG. 3.—PROTECTION OF INTERCONNECTOR BY BALANCED-VOLTAGE SYSTEM.

of this system to protect the generator is shown in Fig. 2, in which, it is seen, the earthing connection of the machine is also brought through the ring transformer.

For protecting generators and banks of transformers, however, the author prefers the modification of the Merz-Price system, shown in Fig. 4. Fig. 3 is a diagram of the ordinary Merz-Price method (called by Mr. Wedmore the "balanced voltage" system), with the two current transformers in opposition, applied to an interconnector between two sub-

stations, and Fig. 4 the modification in which the two transformers simply circulate the current between themselves under normal conditions, and the trip coil is connected in shunt between equipotential points.

A large part of the Paper was also devoted to a critical

Connections are shown for one phase only

FIG. 4.—MACHINE WINDING AND CABLE PROTECTED BY CIRCULATING CURRENT SYSTEM.

review of the various methods of protection with interlocked overload, leakage, or reverse-current relays.

Mr. C. H. Merz, who opened the discussion, said that commercial considerations must ultimately decide the use of any particular apparatus. On the north-east coast they had to supply sub-stations long distances apart by means of one cable, and came automatically to the use of ring mains and static transformer sub-stations without attendants. It was not a question of the cost of the apparatus for feeder protection or the prettiest electrical solution of the problem, but the saving in the lay-out of the system by using this apparatus.

Mr. H. W. Clothier (Reyrolle & Co.) said that the core-balanced system had been used four years ago, and already about 100 circuits were protected by its means. It was a marvel to him that interlocked reverse-current relays had lived so long and still cropped up in specifications. Over 100 miles of cable and overhead lines, he said, were now protected on the split-conductor system, representing over 50 cables. On an estimate, the protective switchgear was called into operation 40 times a year, and on only one occasion had it failed to act as it should have done, and this was due to a fault of construction on the lines themselves, and not to any defect of the system.

Mr. A. M. Taylor (Birmingham Electricity Department) pointed out that the split-conductor system could be of no assistance on existing feeders. He also mentioned that too much reliance must not be placed on the current flowing back to the fault, in the other systems described, as whether this would occur depended on the load normally supplied by the feeder.

Mr. E. G. Waters (Ferranti, Ltd.) described how it was possible by means of his system of feeder protection (see *ELECTRICAL ENGINEERING* of June 25th, p. 369) to overcome the difficulty of applying protection to feeders with T connections to the station side of the feeding point. [We understand that the Ferranti-Waters system is to be applied to protect the cables to be used on the electrification of the London and South-Western Railway.]

Mr. Hollis objected to the Author having said that the devices described acted instantaneously. It took, he maintained, 0.4 sec. for the relay to operate and 0.6 sec. for the switch, and as the rate of rise of current might be 1,000 amperes per sec., the destructive force at the switch break would be considerable.

Mr. H. Brazil (Charing Cross and City Supply Co.) asked what was actually the very little extra cost of the cables on the split-conductor system. He maintained that more than a light insulation was required between the two conductors, as, on a fault occurring, there was the full star voltage between them. He also mentioned that the use of a carbon-powder resistance, with its negative temperature coefficient, would be an advantage for the earthing connection of the centre point of the generator, as it would allow a larger current to pass through the fault to operate the protective device.

Mr. Leonard Murphy (East London College) said that the Author had been too hard on reverse-current relays, and that if there were reactances in the line they had a much better chance.

Mr. Wedmore, in his reply, recommended the Merz-Price system for existing feeders, as it could be applied by means of the existing pilot wires. In reply to a remark by Mr. Taylor as to the extra complication of switches with double contacts on the split-conductor system, he said that it paid to use them rather than to build a bigger transformer. Replying to Mr. Brazil, he said that the cost of the split-conductor system, including the extra cost of the cables, was about the same as the Merz-Price system. The term light insulation between the two conductors was relative; it was sufficient to withstand the full pressure momentarily, and in practice this full pressure was never reached.

**Engineering Societies in Manchester.**—It is now announced that the scheme of co-operation between the various engineering societies in Manchester with a view to the provision of a common meeting room and library, which was considered by a conference last May, has been temporarily abandoned owing to the war.

## THE BREAKDOWN ON THE L.C.C. TRAMWAYS

**B**Y an extraordinary piece of ill-luck the generating station of the L.C.C. Tramways at Greenwich has again been in trouble, and, by a curious accident, was temporarily put out of action on Friday afternoon at about 5 o'clock. Practically the whole L.C.C. tramway service was suspended for many hours, and during the next few days was only resumed gradually day by day, till to-day, for the first time, the full service is running. As our readers know, considerable extensions and improvements to the switchgear are in progress, and a wooden staging had been erected to facilitate this work. Unfortunately, an oil-insulated instrument transformer, already condemned and about to be removed, chose this opportunity to burn out, and the flaming oil set fire to the staging. This fire was very promptly extinguished, but not before the whole of the adjoining main generator cables had been involved, and all these gave out, causing the disconnection of every generator from the bus-bars. The consequent violent surges and current rushes at the moment of short-circuit were successfully withstood by the protective apparatus in connection with the turbo-generators, but two of the old reciprocating sets which are shortly to be removed were slightly damaged, but have been since repaired. No damage of any kind was done to the sub-stations or distributing system. The accident was referred to at Tuesday's meeting of the L.C.C., when Mr. G. H. Hume, chairman of the Highways Committee, made a statement as to its causes.

Mr. Hume said that the trouble arose through a transformer box situated between the generators and the switchboard, and used for the purpose of stepping down the high voltage to the low voltage for the measuring instruments on the board, exploding. This transformer had been in use for ten years, and is the last of its type in the station. Indeed, in another five days it would have been removed altogether. This in itself would not have had serious consequences, but it so happened that in connection with extensions to the switchboard there was a considerable amount of wooden staging near, and the burning oil was thrown out from the transformer box on to this staging, and set the whole of it ablaze. Quite close were the heavy cables running from the generators to the switchboard, and the intense heat naturally destroyed them, and so completely cut the generators off from the switchboard. It is satisfactory to note, however, that the heavy electrical surges thus set up were completely taken care of by the protective devices which were installed after the last accident which occurred at Greenwich, and only those two generators to which this protective apparatus has not been fitted, and which are connected to the reciprocating engines, broke down. These, however, were put right in a very short time. Fortunately no lives were lost, and had the accident occurred five minutes earlier the results might have been very much worse, as at that time there were a considerable number of men on the staging.

Mr. Hume pointed out that the accident in these special circumstances was quite unavoidable, and emphasised that it was in no way due to the fault of the system. At the same time he rendered a tribute to the calmness and the efficiency of the men in the station, who, in spite of the fearful heat, stood to their work and succeeded in putting the fire out long before any aid had been obtained from outside. Night and day work has been continuing since, and it is hoped to have the whole system in full working order by to-day (Thursday). On Tuesday 1,400 cars were running.

A number of questions were put to Mr. Hume by various members of the Council as to the necessity for making arrangements with authorities adjoining the tramway system for a supply in such circumstances, and the Chairman of the Committee testified to the great assistance rendered in the present trouble by, amongst others, the Metropolitan Electric Tramways, Ltd., London United Tramways, Ltd., St. Pancras Borough Council, West Ham Corporation, Leyton U.D.C., Ilford U.D.C., Poplar Borough Council, and the County of London Electric Supply Co. The question of making some permanent arrangements to deal with such emergencies was under consideration. He added that although the tramway load has increased recently the load on Greenwich has not increased, the increase having been met by current taken from outside sources.

The London Electric Supply Corporation point out that the Deptford and Lewisham section of the tramways which is supplied from their Deptford station was not affected, and that they were able to supply increased current to the L.B. & S.C.R. to deal with the additional traffic due to the stoppage of the tramcars.

## THE FUTURE OF LONDON ELECTRICITY SUPPLY

**T**HE Parliamentary Committee of the London County Council has presented a report upon the Bill which has been deposited for next session dealing with the supply of electricity to London and Greater London. We have already given the main details of the proposal, and need only add now that it is suggested that the "Authority" shall consist of 27 members, allocated as follows:—L.C.C., 18; Essex, Hertfordshire, Kent, and Surrey County Councils, 1 each; Middlesex County Council, 2; and the County Borough of West Ham, East Ham, and Croydon, 1 each. It is not essential that all the L.C.C. delegates should be members of the Council, but it is provided that not less than one-half of the 18 shall. The exact boundaries of the area of supply has been slightly modified in order to avoid possible claims for severance in the event of purchase by the Authority. With regard to maximum prices, the figure fixed for railways, tramways, canals, docks, and waterworks is £3 10s. per kw. of maximum demand per annum, plus 0.25d. per unit.

The Bill as drafted contains a proviso that the powers shall lapse if within five years no contract is made between the Authority and a leasing company, but the Parliamentary Committee recommends an alteration so that in that event the Authority shall retain the general powers of control over existing undertakings which are in the Bill in order to assist in the standardisation of supply. The Committee also recommends the deletion from the Bill of the provision defining the duties of the Technical Committee, and substitute merely a power to the Authority to delegate such powers as it thinks fit.

The Hammersmith Electricity Committee recommends that the Bill be opposed, and regrets that the L.C.C. has not held a further conference to give additional information, as was suggested at the Conference held on October 2nd.

On the suggestion of the Wimbledon Corporation, a conference of the Wimbledon, Barnes, Epsom, and Surbiton municipalities is to be held to consider their course of action regarding the Bill. There seems little doubt that they will oppose it.

**Supplies for the Allied Governments.**—All questions relating to the purchase and export of food supplies, munitions of war, and field equipment for the French, Belgian, Russian, and Serbian Governments are now dealt with by the International Commission for the Purchase of Supplies (Commission Internationale de Ravitaillement), the main office of which is at India House, Kingsway, W.C., while the offices of the Russian delegates are temporarily at 192 Cromwell Road, S.W. Application for permission to export goods the export of which from the United Kingdom is prohibited should, if such goods are required by the Allied Governments or their accredited agents, be addressed in writing to the Commission. The Commission will only consider such applications if they are accompanied by documentary evidence as to their official origin, and merchants and manufacturers wishing to supply goods for the use of any of the Allied Governments are warned not to enter into any negotiations until they have ascertained from the Commission Internationale de Ravitaillement that permission for the export of such goods will be granted. Having granted permission to export, the Commission will make the necessary arrangements direct with the Customs authorities for the clearance of the goods, upon receiving from the manufacturer or merchant at least forty-eight hours' notice of each shipment, together with the nature and quantity of the goods, the name and address of consignor and name and address of consignee, the port and approximate date of shipment, the ship or line, the port of discharge, and marks on packages, if any.

**"The Electric Vehicle."**—The first number of the official journal of the Electric Vehicle has just appeared under this title. It is an attractively got-up little publication and contains various articles detailing the satisfactory experiences of uses of electric commercial vehicles in America and this country, and illustrations of a number of types. A description is given of the Edison battery omnibuses running at South Shields, and general notes appear on various aspects of the electric vehicle problem. Details are given of the standard charging plug and garage sign approved by the committee, and some particulars appear of the prices for charging current in different localities. From a detailed list we gather that exactly 100 electric vehicles are now in use or on order in England. The committee have also prepared a set of mail cards illustrating electric vehicles and fleets of vehicles which give some idea of results already accomplished.

**Obituary.**—We regret to record the death of Col. R. K. Birley, C.B., Chairman of Messrs. Chas. Macintosh & Co.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,421.

In the old days the mistake was sometimes made of drawing more than one cable into the same duct. Is there any known method, short of cutting the cable, of finding out whether a concentric cable carrying alternating current, 2,000 volts, single-phase, is "alive" or "dead"?—R. McC.

(Answers must be received not later than first post Thursday, Dec. 24th.)

### ANSWERS TO No. 1,419.

Describe briefly the general design and give particulars of efficiency and working of static balancers for use with 440-volt 3-wire D.C. dynamos, which can be worked either shunt or compound wound, whichever is the more suitable. Two generators will be used of 100 and 50 kw. respectively, both direct-coupled steam sets, running in parallel when the load is heavy; further, for peak loads a battery is also put in parallel. The plant is used for factory driving and lighting. The battery has to be charged during the daytime. State briefly also what extra switchgear and instruments would be required.

The first award is given to "A. G. R." for the reply given in slightly shortened form below:—

An ordinary D.C. machine is fitted with two or more slip rings on the armature, being connected to the winding so as to give single-phase in the case of two slip rings, three-phase with three slip rings, and two-phase with four slip rings. These rings are connected through the brushes to one or more static balancers or balance coils, the mid-point of which provides a mid-point to which the neutral wire of the three-wire D.C. system is connected. Figs. 1 and 2 show diagrammatically the arrangements for an armature with two rings and one with four rings respectively. The static balancer is simply an A.C. transformer with a single winding having a tapping at its mid-point. Since it is connected to an A.C. circuit an alternating magnetising current

FIG. 1.

FIG. 2.

flows through its windings, but the magnitude of this current is ordinarily so very small that it may be neglected when considering the flow of direct current from the neutral line to the armature. The designing of these coils presents little difficulty. The alternating voltage at the slip rings will have a frequency equal to the number of pairs of poles  $\times$  speed in revs. per sec. Assuming a sine distribution of flux and taking the case of an armature having two slip rings, the coil must be designed for a voltage of D.C. voltage  $\sqrt{2}$ , and since the currents in the two halves of the winding are equal and flow in opposite directions, they

have no effect whatever in magnetising the core of the balancer, and as the ohmic resistance of the winding can be kept very low, the drop across the coil is usually very small. In designing, this drop is generally limited to about 1.5 per cent. of the voltage across the balancer; this means a low current density and a low copper loss. Where the generator is compound wound, it is usual to divide the series winding into two equal parts, one in series with the positive and the other in series with the negative brush. In this case the compounding will be the same with a load on either side of the neutral wire, but with a certain definite current the series amp.-turns will be twice as great with a load across the outers as with a load between the neutral and the outer. Therefore in high-speed machines the conditions of com-

FIG. 3.

A, Ammeters; V, Voltmeters; SB, Static Balancers, connected to generator slip-rings; f, Fuses; l, Links.

mutation may become severe, and it is customary in such cases to limit the unbalanced current to about 10 per cent. of the full load current. In slow-speed machines with more favourable conditions an unbalancing of 25 per cent. is frequently allowed. The efficiency of static balancers, correctly designed, is high, and may often reach 99.8 per cent., but 99.5 per cent. is a good average figure. Fig. 3 shows the diagram of connections required using shunt machines. The only difference with compound is that two equalising connections will be required. Switches and fuses have been included, but these could, of course, be replaced by circuit breakers if desired.

The second award (5s.) is made to "KORL," the principal points in whose reply are given below:—

A static balancer is practically a choking coil, or series of choking coils, connected to points of the winding (via slip rings) in a wave-wound armature  $180^\circ$ ,  $120^\circ$ , or  $90^\circ$  ( $180^\circ$  between the ends of each coil), &c., apart, according to whether a two, three or four-phase, &c., balancer is used. The alternating voltage across the slip rings is of the same dimensions as in a rotary converter, and the middle point of the coils is at a potential half-way between the outers. The design of a static balancer is on similar lines to that of the primary of a static transformer, but that the alternating magnetising current and the ohmic resistance of the windings must be reduced to a minimum from considerations of regulation and efficiency. The direct current in the middle wire is superimposed upon the alternating current, and the construction must be such that the magnetisation due to it is counteracted, otherwise bad regulation and inefficient working will result. This is easily effected in two-phase two slip ring or four-phase four slip ring balancers by winding the coils concentrically, or in sections and interleaving them in such a manner that the direct-current magnetisation is mutually neutralised, it being observed that this current is either to or from the centre of both coils at the same time and is equally distributed in them. In three-phase three slip ring balancers, this arrangement is not possible owing to the odd number of limbs, and it is therefore necessary to wind an extra coil on each limb in series with the middle wire, solely for the purpose of neutralising the direct-current magnetisation. The commutation must be carefully watched, since with an out of balance current there is an unequal distribution in the armature windings with maximum "piling up" in those coils nearest the tappings at the time they are about to be commuted. For this reason an increase in the number of tappings will improve the commutation and also regulation and will reduce the local heating. When the out of balance current is expected to be more than 20 per cent., a four or more phase balancer should be fitted, otherwise a two-phase balancer should be satisfactory, provided, of course, the frequency is not less than 18 to 20 cycles

per second. Dynamos with or without interpoles should have half of all series windings connected on each polarity of the machine, those on one side being on alternate poles, this giving a compounding and commutating pole effect proportionate to the whole load and also improving the regulation. Two equalising leads are therefore necessary for a compound-wound machine which has to work in parallel with others. The regulation obtained with a given out of balance current depends upon the

resistance of the balancer coils, armature, brushes, commutating pole and series winding, the difference between the voltage on the two sides of the system being twice the drop in such of these parts which are on one side of the machine due to the out of balance current. In a well-designed set this should not exceed 3 per cent. to 4 per cent. of the voltage on one side. "Koil" also sends a diagram of the complete switchgear and connections, generally similar to that given in Fig. 1.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Dec. 10th, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

23,454/13. **Electrolytic Cleaning.** E. LE R. COUCH. An elaborate apparatus for cleaning articles electrolytically, comprising several vessels containing a special electrolyte through which the articles to be cleaned are passed continuously, by a moving metallic belt with which they make contact. Storage vessels are provided from which the liquid is pumped, and automatically moistened moving brushes effect a partial cleaning before the articles are taken through the electrolytic baths. Steam jets also assist in the cleaning. (Eight figures.)

26,497/13. **Electric Cooking.** A. F. BERRY. Ovens provided with several heaters and fitted with a series of movable baffle plates, which can be set so that the current of heated air either circulates up the middle and down the side of the oven or vice versa. (One figure.)

28,826/13. **Meters.** B.T.-H. Co. and A. P. YOUNG. A.C. meters comprising a cup rotating in the gap of an electromagnet on which the potential coils are wound, and surrounding polar projections carrying the series coils. The magnetic circuit is completed by the side pillars of the instrument, which are provided with adjusting screws of magnetic material to regulate the flux. (Four figures.)

133/14. **Flash Lamps.** F. ESTÈVE. Electric pocket flash lamps supplied by a magneto actuated through gearing by pressure on a lever. (One figure.)

9,840/14. **Telephone Exchanges.** G. A. BETULANDER. A telephone exchange system in which connections are established between a group of subscribers' lines on the one side, and the incoming and outgoing junction lines common to the subscribers' lines on the other side characterised by the division of the group of subscribers' lines into a number of sub-groups, each having at its disposal a number of intermediate lines adapted to make connection with any incoming as well as any outgoing junction. (Ten figures.)

17,487/14. **"Wired Wireless" Telegraphy.** G. O. SQUIER. A system of wave telegraphy or telephony employing a horizontal conductor used for transmitting direct or low-frequency currents by ordinary conduction, such as a telegraph or telephone line, a vertical antenna connected to the receiving end, and a frequency bridge or detector circuit superposed on the line at or near the vertical antenna. (Two figures.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.\*

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** ST. HELEN'S CABLE & RUBBER Co. and WHITE [Securing cables] 3,323/14 and [Wall junction boxes] 19,192/14.

**Heating and Cooking:** COX [Heating resistances] 26,546/13; HEARSON [Cooking and sterilising apparatus] 26,835/13.

**Instruments and Meters:** EVERSHED & VIGNOLES, LTD., and EVERSHED [Indicating apparatus] 29,545/13.

**Switchgear, Fuses, and Fittings:** CURTIS, PICKETT, COLTON and IGRANIC ELECTRIC Co. [Electromagnetic switches] 26,575/13; HOLOPHANE, LTD., and STROUD [Fittings for shades] 28,498/13; HART [Switches] 8,038/13; CURTIS, MACKLEY and IGRANIC ELECTRIC Co. [Controlling devices] 10,623/14; STORER [Control systems] 17,465/14.

\* It is announced that from Jan. 1st, 1915, the price of printed specifications will be 6d. each, including postage, instead of 8d. as at present.

**Telephony and Telegraphy:** MARCONI'S WIRELESS TELEGRAPH Co. and ROUND [Wireless receivers] 27,480/13; BROWN [Telephonic connections] 29,245/13.

**Traction:** J. STONE & Co. and DARKER [Train-lighting switches] 27,249/13; BIDDLE [Train stops] 27,366/13.

**Miscellaneous:** VON TAGUEFF [Ozoniser] 27,249/13; SMITH [Colliery signals] 28,004/13; GILES [Condensers] 19,868/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, &c.:** A.E.G. [Air filters for generators] 22,950/14.

**Electrochemistry:** SOC. GEN. DES NITRURES [Fixation of nitrogen] 22,586/14.

**Incandescent Lamps:** A. B. C. SCHRIFTLAMPEN GES. [Metal filament lamps] 7,591/14.

**Telephony:** GES. FÜR ELEKTRISCHE INDUSTRIE [Prepayment apparatus] 29,645/13.

**Miscellaneous:** SIEMENS & HALSKE A.-G. [Remote control] 22,927/13.

The following Amended Specifications can now be obtained:—

**Colliery Signalling:** J. J. ADLINGTON, 8,975/14.

**Lamp Glowers:** E. PODSZUS, 18,323/13.

### Opposition to Grant of Patents

24,755/13. **Insulators.** F. HANDCOCK. The grant of a patent on this application has been allowed in spite of opposition. The specification describes a tool for boring holes in porcelain insulators during manufacture.

### Application for Revocation

27,664/12. **Car-lighting Dynamos.** BROULT, LTD., B. BROOKS, and W. HOLT. An application for the revocation of this patent has been received. The specification describes a self-regulating dynamo with auxiliary poles carrying a regulating winding connected to additional brushes.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

23,389/00. **Rotary Converter Control.** B.T.-H. Co. (*D. Lunt, U.S.A.*). This specification describes several methods of maintaining constant speed of inverted rotary converters by automatic regulation of the field in response to variations of lag or lead in the current supplied by the machines.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** B.T.-H. Co. (*R. H. Read, U.S.A.*) [Lamps with metallic carbide electrodes] 17,194/01; S. C. MOUNT and BECK FLAME LAMP Co., LTD. [Multiple carbon lamp] 19,387/09.

**Dynamos, Motors, and Transformers:** G. A. MUDGE [Non-sparking pole-tips] 9,554/07; D. DUPONT and HARLÉ & CIE. [Motor control] 17,852/08; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Rotary converters] 18,053/08.

**Electrochemistry and Electrometallurgy:** H. PAULING [Electric furnaces] 18,901/07.

**Ignition:** R. BOSCH [Electromagnetic sparking plugs] 30,049/09.

**Instruments and Meters:** S. Z. DE FERRANTI and W. HAMILTON [Meters] 18,766/02.

**Switchgear, Fuses, and Fittings:** J. A. KENNEDY-McGREGOR and H. WREN [Switches] 18,317/04.

**Telephony and Telegraphy:** A. POLLAK [Relays] 19,282/07; SIEMENS BROTHERS & Co., LTD. [Order telegraphs] 19,684/09.

**Traction:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Single-phase motor control] 19,120/06; W. M. HERD and A. ESPLEN [Electric carriage locks] 19,264/07; W. A. STEVENS [Control of petrol-electric vehicles] 17,822/08; SIEMENS BROS. & Co., LTD. (*Siemens & Halske A.G.*) [Switches for railway signalling] 19,662/09.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Annual Report of the Postmaster-General for the year ended March 31st, 1914, records an increase of 108 in the number of telegraph offices, which was then 14,152. The total number of telegrams transmitted shows a slight decrease, but was over 87,000,000. This is explained by the growth of the telephone system. The telephone has replaced the telegraph at many offices where the traffic is light. Improvements are being made with high-speed apparatus. The Gell perforator, and the Creed reperforator and printer, are being more extensively used; a new Siemens' instrument is being tested, sextuple working has been applied to the Baudot apparatus between London and Birmingham, and Quadruple duplex sets are to be installed between London and Liverpool and between London and Glasgow. A new form of Murray multiplex apparatus is also being worked experimentally between London and Manchester. Among the extensions of the underground system it is mentioned that the lines from London to the landing places of the French, Belgian, Dutch, and German cables are now all underground. By means of "phantom" circuits a certain amount of telegraphy is now carried out over telephone circuits. Several circuits, especially in Scotland, are equipped in this way for emergency use. There has been considerable amplification of the coast communication system. It is needless to quote from the report as regards foreign telegraphs, as there has been much rearrangement owing to the war since the report was written.

With regard to wireless telegraphy, the report refers to the coming into force of the International Convention in July, 1913, and states that 879 British ships carried wireless installations under licence from the Post Office, as compared with 646 a year before. New stations have been opened at Land's End and Fishguard, replacing those at the Lizard and Rosslare. The stations at Malin Head and Niton have been transferred to new positions in the neighbourhood, and new stations are recorded as being nearly ready at Valencia and Guernsey. The projected station at Stonehaven is also mentioned. The progress of the stations forming the Imperial wireless chain is summarised. Sites have been acquired for the sending aerial at Leafield, near Oxford, and the receiving aerial at Bishop's Cannings, near Devizes, and the erection of the masts is in hand. Sites have also been selected in Egypt at Abu Zabal, near Cairo, and Abu Sueir, near Ismalia. The Indian Government are proceeding with arrangements for erecting aerials in the neighbourhood of Poona. Sites have also been provisionally selected in East Africa near Nairobi, and in the Transvaal. Provisional steps have been taken for the selection of sites in the Straits Settlements.

The number of telephones belonging to the Post Office is given as 774,821, and 184 new exchanges were opened during the year, bringing the total up to 2,831. In London, twenty of the National Telephone Company's exchanges were replaced by new exchanges in new buildings. In addition, preparations had been nearly completed for opening the "Museum" exchange, and sites have been obtained for three other large

exchanges in the East Central and West Central districts. New underground cables were commenced between London and Brighton, Glasgow and Edinburgh, Newcastle and Sunderland, Cardiff and Swansea, Barnsley and Sheffield, and other centres. In December a telephone cable was laid from Carnarvonshire to Dublin Bay. This, about 72 miles long, is the longest submarine telephone cable in the world, and will afford three and possibly four additional channels of communication. Automatic telephone exchanges are being constructed at Newport (Mon.), Darlington, and Hereford, and are about to be commenced at Accrington, Chepstow, Dudley, Grimsby, Paisley, Portsmouth, Leeds, and Stockport. Arrangements have also been made for a trial of automatic equipment of a type which is intended for use in small exchanges in country districts.

A brief account of the short-distance wireless telephone apparatus with which Mr. Marconi is reported to have made successful experiments between ships of the Italian Navy recently, is given in the *Wireless World*. The combined transmitting and receiving set weighs 59 lb. The transmitter is a specially constructed "Marconi oscillation valve," shunted with a resonating system of condensers and inductances from which continuous oscillations are produced of a frequency controlled by variable ebonite condensers. This system is inductively coupled to the aerial of a variable coupling. These continuous oscillations of constant amplitude produce no sound in the receiver until the variations required for transmitting speech are made by the microphone. The microphone can be at any distance from the transmitter. The filaments of the transmitting valves are supplied at low pressure by an 80 ampere-hour accumulator, and the E.M.F. applied to the vacuum of the valve is supplied by a dry battery consisting of five cases of cells and giving 500 volts; only about 10 to 20 milliamperes is required. The receiver consists of an oscillation valve and crystal set of high sensitiveness. The set can be also used for continuous-wave telegraphy with suitable aeralis up to 100 miles range.

The Portuguese telegraph authorities have put into force Rule 8 of the Telegraph Convention, and have prohibited for the time being all traffic between Fayal, Azores Islands, and North America *via* the cables of the Deutsch Atlantische Company.—The Singaradja-Amperon cable is down.—Telegrams for Lombok Island are sent by post from Soerabaja, Singaradja, or Makasser.—The Russian Administration states that all telegraphic intercourse with Turkey is suspended.—Radio-telegraphic communication between Bari and Antivari is interrupted.—Persian lines Behbahan-Ahvaz-Mohammereh restored.—The Japanese Government state that restrictions regarding private telegrams in force on August 21st last are substituted by the following: Senders or receivers of telegrams must furnish on demand explanatory notes in Japanese, English, or French with telegrams or the codes if necessary.

It is announced that, owing to the war with Turkey, the half-year's interest due on January 1st next on the 6 per cent. Obligation Bonds of the Constantinople Telephone Co. must be postponed. It is stated, however, that the telephone service in Constantinople is still being maintained under the direction of the British staff.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**COOKING APPLIANCES.**—A collection of leaflets describe the latest designs of several pieces of cooking apparatus, separate heating discs, &c., manufactured by Ferranti, Ltd. (Central House, Kingsway, W.C.). Particular attention may be called to the substantially built electric ovens and complete cookers, of which several new forms appear.

**INCANDESCENT LAMPS.**—A list from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) deals with all classes of Robertson carbon filament lamps both for lighting and radiators. These lamps are made at the Robertson Lamp Works at Brook Green, and the bulbs are blown at the company's glass works at Lemington-on-Tyne. Owing to the increased cost of manufacture, a slight rise has been necessitated in the cost of lamps in coloured glass bulbs.

**HEATING AND COOKING APPARATUS.**—We have received from the Western Electric Co., Ltd. (North Woolwich), a leaflet describing a circular open coil flat electric stove, which is suitable

for toasting, frying, boiling, or grilling. The apparatus appears strongly made, and the same applies to an electric iron listed in the same leaflet.

### A LUMINOUS HELM INDICATOR

A NEW piece of apparatus put on the market by Siemens Bros. & Co., Ltd. (Woolwich), is an indicator which shows by means of illuminated windows of different colours when the rudder is amidships, and when hard over to port or starboard. The instrument serves as a check on the accuracy of the telemotor or other controlling gear, and is of simple construction. The indicator on the bridge or in the wheel-house consists of a teak case provided with three windows, the centre one fitted with white glass which is illuminated when the rudder is amidships, whilst the side ones are fitted with red and green glass respectively for indicating when the rudder is hard over. Lamps are mounted behind the windows, and are switched on and off by means of the transmitter fixed near the rudder post, and connected to it by means of rods. The current required for the lamps is taken from the lighting circuits of the ship or from batteries. The transmitter is mounted in a watertight case, and is of strong construction.

## A NOVEL ELECTRIC SIGN

WE illustrate here an electric sign which Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), have recently completed to an order received through their Singapore branch. The sign is 14 ft. long by 2 ft. 8 in. wide and 1 ft. deep, and is to be fixed from the roof of a very lofty store. The local regulations prohibit the fixing of a sign which projects more than 3 ft. deep, and it was therefore necessary to arrange the advertising matter on the sign to read vertically. The Chinese characters lend themselves to this style of design, and the top three, which are visible day and night, represent the name of the store. This lettering changes in colour, red, yellow, and green in succession, when illuminated at night time, with a complete blanking-out in between the different colours. Each of the remaining panels advertise some article manufactured by the store, and they figure on the sign in rotation in the same colour as the name of the firm appears, so that with each change of colour in the name there is a change of advertisement on the sign itself. These lower panels appear absolutely blank in the day time. The wavy beaded border is arranged on the chasing flasher basis—two sections of twelve beads, that is, two lengths of approximately 18 in. are blanked out mechanically in succession all round the border. In order to obtain the results described, about thirty distinct lamp circuits had to be wired, and the number of Wotan lamps employed is about 150. These have been varnished by the Siemens process, in order that they will satisfactorily withstand the weather conditions. The flasher is of the motor-driven pattern and controls the main panel circuits and the border. The sign is double-sided, with similar panels on each side. It is finished black stove enamel outside and white inside.

## TRACTION LAMPS

WE have received from the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex, and 123-125 Queen Victoria Street, E.C.), some particulars of the metal filament lamps which they have specially designed for use for shipping, railway, tramway, and similar work where the conditions demand a stronger lamp than usual. The filaments are of pure drawn tungsten wire, and the design permits of short lengths being used, thus ensuring

METAL FILAMENT  
TRACTION LAMP.

the necessary rigidity and strength. The standard type of lamp for electrically-propelled trams and trains measures 4 in. overall, 2½ in. diameter; is in the popular pear-shaped bulb, and rated at 100 volts 30 watts, this small size being convenient to save headroom, and is suitable for all standard fittings. For cases of lighting railway carriages from dynamos and accumulators on any of the well-known systems, a smaller bulb is used, round in shape, and with the glass pip or seal point concealed in the collar. This lamp measures 2½ in. long overall, and bare 2 in. diameter. Great care is taken in the manufacture of the lamps, the wire is specially selected, and the glass stems supporting the wire are made stronger than in the usual type. In this connection it may be mentioned that motor-car head and side lamps and motor-car and omnibus lighting lamps are also a speciality of the Company, who have for many years been the manufacturers

of the C.A.V. motor-car lamps. In the former case, to get a good focussing effect, and incidentally to get the filament into as small a bulb as possible, the filament is wound in the form of a double helix, giving it great strength and resistance to shocks and vibration. For lighting purposes small lamps are used, in some instances what is known as the festoon type, with the wire in a tubular bulb with a terminal at each end, and in other cases a lamp with a small round bulb, from 1¼ in. to 1½ in. diameter, is made for running off a small accumulator set. The lamps are made throughout, from the glass bulb to the lamp collar, entirely at the Ponders End Works of the Edison & Swan Co., a firm entirely British as to shareholders, directors, staff, and employees.

## ALTERNATOR REGULATORS

THE General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, E.C.), manufacture a number of different patterns of regulator for controlling the exciting current of large generators. Their rectangular type, with strip resistance, has been described in *ELECTRICAL ENGINEERING*, but the accompanying illustration shows a quite different pattern, supplied to a municipality for the control of a 5,000-kw. turbo-alternator. It consists of a circular face-

VIEW OF REGULATOR, WITH COVER REMOVED TO SHOW CONNECTIONS.

plate regulator of extremely strong construction, mounted on the same angle-iron framework as a cast alloy "grid resistance." The connections between the contacts and the resistance are of solid copper bar; the regulator contacts are turned round at right angles and the copper rods are screwed to them, so that there are no loose wires.

**Installation News.**—The attractive little magazine of this name issued by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), has reappeared in amplified form as the first issue of a new series. It contains some brightly written notes and comments on the present situation and illustrated articles on novelties recently introduced by the firm. Some excellent suggestions are made regarding electrical Christmas presents.

**The Strength of Metal Filament Lamps.**—The Edison & Swan Electric Light Co., Ltd. (Ponders End, Middlesex, and 123-125 Queen Victoria Street, E.C.), send us a copy of a letter from the Front describing a house which had been heavily shelled by the enemy where an Ediswan lamp was still hanging from the ceiling perfectly intact, although almost every other thing in the house had been smashed in some way.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Altrincham.**—An inquiry was held last week concerning a loan of £675 for street electric lighting. Mr. H. R. Hooper, the L.G.B. Inspector, suggested that incandescent gas lighting would have been more advisable, and commented upon the unbusinesslike policy of the Council in not having detailed figures available. The Council is to give further consideration to the scheme.

**Bacup.**—The Council requires a 100-kw. and a 50-kw. transformer.

**Greenock.**—The Electricity Committee proposed to borrow £90,000 for extensions at the electricity works.

**Middleton.**—A loan of £273 is to be taken up for electricity purposes.

**Newcastle-under-Lyme.**—Sanction to a loan of £1,350 has been received for cables and storage battery.

**South Africa.**—A complete electrical installation is required by the Mossel Bay municipality. Further particulars at 73 Basinghall Street, E.C. Jan. 12th, 1915.

**Wednesbury.**—An inquiry has been held regarding a loan of £2,146 for a transformer station, rotary converter, cables, &c., in connection with the bulk supply from the Midland Electric Corporation for the King's Hill district.

**Weymouth.**—A loan of £2,100 has been sanctioned in respect of new generating plant.

### Wiring

**Ayr.**—Electric lighting at the Heathfield Hospital.

**Cardiff.**—King George Buildings. Architects, I. Jones and S. Thomas, 6 & 7 St. John Square.

**Penistone.**—Lighting of workhouse.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Chesterfield.**—Two schools, £11,844.

**Newcastle-on-Tyne.**—Additions Bath Road School, £5,870.

### Miscellaneous

**Sunderland.**—Six months' supply of electrical stores for the Guardians. Clerk, 17 John Street. Dec. 28th.

## TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**Barrow-in-Furness.**—The tender of the British Thomson-Houston Co. has been accepted for a 2,000-kw. turbo-alternator with condensing plant at £6,718.

**Dewsbury.**—The tender of the Union Cable Co. has been accepted for cable.

**Torquay.**—An offer by the British Thomson-Houston Co. to supply a turbo at £3,837, condensing plant at £1,247, and rotary converter at £1,163, prices slightly higher than were charged for similar plant already installed, is recommended for acceptance.

**Uxbridge.**—The Uxbridge Electric Supply Co. has received the contract to instal electric driving at the sewage works.

**Fire at the Edison Works.**—The recently reported fire at Mr. T. A. Edison's headquarters, where the works of several of his concerns are situated, affected only the phonograph departments. We are informed by Edison Accumulators, Ltd. (2 and 3 Duke Street, Piccadilly), that the remainder of the buildings and machinery are intact, including those devoted to the Edison storage battery, which are working to their full capacity of 3,000 cells per day.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £61 10s. to £62 (last week, £58 10s. to £59.)

**Canadian Agency.**—A Montreal agent desires to represent British makers of tungsten lamps and electrical fittings.

**Change of Address.**—On and after Dec. 24th the address of Scholey & Co., Ltd. (now of 151 Queen Victoria Street, E.C.), will be 56 Victoria Street, S.W. (Telegrams, Scolanco Sowest London; telephone, Victoria 6663, two lines.)

## APPOINTMENTS AND PERSONAL NOTES

By the will of the late Mr. Augustus Stroh, the Building and Benevolent Funds of the Institution of Electrical Engineers will benefit to the extent of £250 each.

Alderman John Brown, who has played such a conspicuous part in the development of the Hull municipal telephone service, has been presented with a "Telephone Testimonial," consisting of a grandfather clock.

Mr. T. P. Walsh, switchboard attendant at the Dewsbury Electricity Works, has resigned. Mr. R. P. Jones has been promoted from switchboard attendant to shift engineer.

The Ipswich Electricity Department requires a draughtsman; and particulars are given in our advertisement columns of vacancies for switchboard attendants, wiremen, and a works electrician.

## LOCAL NOTES

**Bolton: Competition between Departments.**—The Electricity Committee having secured the work of lighting certain streets after competitive tenders with the Gas Department, the representatives of the latter on the Corporation suggest, as has been done elsewhere, that there should not be competition between departments. The scheme is to proceed.

**Move: Electricity Charges.**—The Council has decided to reduce the charge for current for power purposes from 2'13d. to 1'5d. per unit. Some adverse comment is being made locally of the decision not to reduce the charge for private lighting until the existing plant has been superseded by more modern plant. It is pointed out that Sir Alexander Kennedy, in his report to the Council, recommended a reduction of ½d. per unit all round, making the price for lighting 4'75d. and for power 1'63d. per unit.

**Liverpool: New Generating Plant.**—A new 8,000-kw. three-phase 6,000-volt turbo-alternator was started up at the Lister Drive power station last week.

**Sheffield: Dispute with Wiring Contractors.**—The Council has discussed in Committee the charge by the local wiring contractors that the Electricity Department is continuing to trade in wiring and fittings contrary to the Corporation Act of Parliament. The Committee argue that the contractors wish to negotiate on the basis that the Council's trading department should be closed down, which, it contends, is quite contrary to the clause in the Act. They suggest a scheme whereby fittings may be sold through a contractor, and also recommend that the show-room and department be continued. This was passed, but the contractors are threatening to take the matter to the law courts again.

**Southport: Street Lighting.**—Owing to the shortage of carbons, the Electricity Committee recommended the Corporation to discontinue the whole of the street arc lighting until further notice. There was naturally some considerable discussion upon this, and it was eventually decided to discontinue the arc lighting on the promenade and to reduce the rest of the electric lighting in the borough by one-half.

## SUMMARY

DURING the bombardment on the East coast last week, seven men were killed at Richardsons, Westgarth's works at Hartlepool, and the Secretary of the Scarborough Electric Supply Co. was killed at his house. The electricity works at Hartlepool, Scarborough, and Whitby escaped injury (p. 646).

WE draw attention to the effect which the Long Eaton judgment with regard to preferential charging is having upon certain other supply undertakings (p. 646).

RESULTS of tests of the Oerlikon turbo-alternators at Marylebone show remarkable figures of steam consumption (p. 646).

A NEW 6,000 kw. B.T.-H. turbo-alternator has been started-up at the Liverpool Electricity Works (p. 647).

THE protection of the low tension side of transformers from accidents due to high voltage is discussed in our "Questions and Answers" columns (p. 648).

THE lighting of the camps for the two battalions raised by the Glasgow Corporation was switched on last Monday. There are in all about 1,100 lamps. The order for the lighting was only given on Nov. 15th (p. 649).

WE give a few details of the activities of the Association of Supervising Electricians (p. 649).

SEVERAL technical books are reviewed on p. 649.

AMONG the subjects of specifications published by the Patent Office last Thursday were heating elements, wireless telegraphy, telephone connections, and train

control. A patent for helical lamp filaments is opposed. A patent for an electric number sign expires this week after a full life of fourteen years (p. 650).

A NEW form of thermal telephone was shown in London recently. Prof. Howe gave a lecture before the Wireless Society of London on high frequency resistance last Friday. The use of high speed printing telegraph apparatus is rapidly increasing (p. 651).

WE give some notes on the steps taken to reinstate the supply after the accident at Greenwich. This occurrence has been made the occasion of a political attack in the Council.—Cab signalling on locomotives has been discussed by the Institution of Mechanical Engineers (p. 651).

OUR Trade Section contains descriptions of British-made outside lanterns, new glassware, and an arc lamp carrier (pp. 652-653).

MAINS, services, and meters are required at Bethnal Green and Hampstead; mains at Wolverhampton; new plant at Huddersfield (£20,000); engine and boiler plant and switchgear at Bolton; and transformer testing apparatus at Sydney (p. 645).

THE L.C.C. Finance Committee has refused to grant forty-two years for a loan for mains at Bethnal Green, but the dispute with the St. Pancras Council as to reducing the existing forty-two year periods on that undertaking has been settled in favour of St. Pancras.—The Hampstead Council is contributing towards the cost of the Ilford preferential charging case (p. 645).

**The Electric Vehicle Committee.**—At a recent meeting of this committee it was decided to make another effort to bring all electric-supply undertakings into line in regard to a flat rate of 1d. per unit for the supply of electric energy for charging vehicle batteries at times other than those during "peak" load, and to approach those undertakings which had adopted a high minimum charge with a view to their reducing it to a figure more near to that which the committee recommended. The matter of standard rim diameters for vehicle wheels was discussed, and it was decided to support the efforts which are being made by the Motor Manufacturers and Traders' Association to get certain diameters standardised for this purpose. In regard to membership of the committee, it was decided that the present members should hold office until March 31st next, when they may be re-elected by the bodies which they represent. It was decided to ask the British Electrical Federation, Ltd., to nominate a representative on the committee. As to methods of charging electric vehicle batteries, it was decided to point out to the battery makers that the most convenient method of charging, from the charging station point of view, is that which is carried out at constant potential and automatically tapering current, and to ask the makers how far they can supply batteries to comply with this requirement. As to lamps for use on electric vehicles, it was decided to confer with the Tungsten Lamp Association with a view to getting certain sizes standardised for this purpose. The final revision of the specification for the charging plug and receptacle was completed. It was decided to recommend that where the charging current required by a large vehicle exceeds the safe current-carrying capacity of the plug and its charging cable, two plugs and connections should be used in parallel.

## THE EAST COAST BOMBARDMENT

THE following is an extract of a letter received from Mr. H. F. Friederichs, the Borough Electrical Engineer of West Hartlepool:—

I am glad to say we got off scot free, and considering the number of 4-, 6-, and 12-inch shells fired during the fifty minutes' bombardment, I think the damage all round was very small. If the enemy's marksmanship had been better our sufferings would have been truly appalling. Shells which fell in the roads and footpaths left our cables exposed in many places, but, wonderful to relate, they were all undamaged; not a single pane of glass was damaged at either power station or sub-stations, yet shells were bursting all round.

The tramways suffered most—the office at the dépôt had the roof and a couple of rooms wrecked, and the clerk there at the time was rather badly knocked about, and a few cars were also damaged. The overhead lines between the Hartlepoons were knocked down in two or three places, and also on the Park Section. Our Tramway Manager, Mr. Burgess, has his hands full now repairing in order to cope with the traffic; everyone is cooling down and sight-seeing, and added to them are visitors from afar.

I suppose the whole affair was so sudden that people forgot to switch off their motors, heating and cooking apparatus, and lights (it was a dull, foggy morning); anyhow, the switchboard showed the usual load, and I really did not like to give the order to shut down and clear out or hide for safety, as a shut down might only add to the discomfort of those who had hidden themselves in any dark corner or place of safety, so we kept running all the time. I think my lads all deserve the V.C. for sticking it, for if they were not thinking of themselves, they were of their wives and kiddies at home.

Mr. D. B. Morison, the Managing Director of Richardsons, Westgarth & Co., Ltd., whose works are on the coast, writes us:—

Unfortunately, seven of our men were killed, but the damage to the works is trifling, and we shall be in full swing again on Monday [Dec. 21st]. All the staff escaped, but had the bombardment been half an hour later the consequences might have been serious, as the offices were badly peppered with shrapnel.

[A subsequent letter received from the company states that the actual damage was confined to the partial destruction of a few roofs and a great number of broken windows. No work in progress or machines were injured.]

From Mr. J. W. Piggott, Electrical Engineer to the Whitby U.D.C., we have the following report:—

I am glad to say that our station, which was in a direct line of the firing, received no damage. The only damage we suffered was the blowing over of two lamp-posts.

Mr. F. G. Holden, Resident Engineer of the Scarborough Electric Supply Co., Ltd., writes:—

Our station escaped all damage, except for a certain amount of glass being broken by concussion of explosion of shells in the vicinity. None of the network has suffered, except that the overhead wires of the tramways company has been brought down in several places in the town. Our Secretary, Mr. John Hall, was killed by a shell which exploded at his residence. Being a prominent citizen, with active municipal and magisterial interests, he will be much missed in this his native town.

## PREFERENTIAL CHARGING

THE Long Eaton judgment on the question of preferential charging, which held that a consumer cannot be given a special discount because he uses electricity solely for either lighting or power, or both, is having an echo in various parts of the country. We have already, on several occasions, referred to the Ilford case. It will be heard early in January, and as municipalities all over the country are subscribing funds towards meeting the cost of the defence, it is apparently thought that there are circumstances in the case which differentiate it from Long Eaton.

The South London Electric Supply Corporation, according to their tariff, were willing to supply consumers, not using gas, at  $\frac{1}{2}$ d. per unit less than consumers who did, and even before the Long Eaton case was heard, the South Metropolitan Gas Co. challenged the legality of the offer. At first the case was to be fought, but the Long Eaton judgment compelled the South London Electric Supply Corporation to abandon the defence, and before Mr. Justice Eve in the Chancery Division last week the gas company applied for judgment. The only point, then, was whether the Gas Co. should have an injunction or, as in the Long Eaton case, a declaration that the offer was a breach of Sections 19 and 20 of the Electric Lighting Act of 1882. Mr. Justice Eve granted a declaration.

The Electric Supply Corporation, which supplies in a large number of towns in England and Scotland, have also, in consequence of the Long Eaton decision, withdrawn a 10 per cent. rebate granted to customers using electricity for lighting throughout their premises.

## TURBO-ALTERNATOR TESTS AT MARYLEBONE

THE two 3,000-kw. Oerlikon turbo-alternators which formed the first instalment of A.C. plant at the Marylebone Electricity Works, and were described in an illustrated article in ELECTRICAL ENGINEERING (Dec. 4th, 1913, page 675), were remarkable as being among the first machines of such size in this country to run at as high a speed at 3,000 r.p.m., and it is interesting to give some of the test figures of steam consumption which have been attained, and are remarkably low.

The two machines gave their normal load of 3,000 kw. at 6,660 volts three phase 50 cycles normal load, with a temperature rise not exceeding 54° F. after six hours, and their overload capacity of 4,200 kw., with a temperature rise not exceeding 81° F. after six hours. The following are the steam consumption in lbs. per kw.-hour, guaranteed and realised on test for a steam pressure of 190 lb. per square inch, and steam superheated to 485° F., with a 95 per cent. vacuum:—

	Set No. 1.	Set No. 2.	Guaranteed.
Full load .....	12'88	12'92	13'27
Three-quarter load .....	13'04	13'21	13'73
Half load .....	14'00	14'05	14'70

Mr. A. H. Seabrook has expressed great satisfaction with the economy of the sets, and from some output figures for the station that we have seen it is evident that they are taking a large portion of the load. The tests were so satisfactory that the Oerlikon Co. have had no objection to the raising of the allowable overload somewhat and increasing the steam temperature by another 100° F.

**The Effect of Vacuum on Steam Turbines.**—In a paper read recently before the Institution of Mechanical Engineers, Mr. G. G. Stoney, F.R.S., reviewed the question of the relation between vacuum and efficiency in steam turbines. He showed how the degree of vacuum which gave the same velocity ratio at the exhaust end as throughout the turbine was the vacuum under which the best results were obtained. Consequently a turbine designed for 29 ins. vacuum required more rings of blades than one for 27 ins. The percentage gain due to vacuum depends on the steam conditions much more with low pressure than with high-pressure steam, but the gain in B.Th.U. available was almost independent of the steam condition. From tables given in the pages it appeared that whereas the gain in economy between 24 and 25 ins. was 3 per cent. for certain h.p. steam conditions, and 10 per cent. for low-pressure steam, it was 13 and 27 per cent. respectively between 29 and 29½ ins. at full load. There were practical limitations to the velocity of the blades at the exhaust end, but these still left a gain of 6½ per cent. between 28 and 29 ins. It was the aim of designers to increase the limiting vacuum by using higher blade speeds and enabling an exhaust end of larger dimensions to be employed. At fractional loads the gain due to high vacua was even more marked, the more so with throttle than with nozzle governing. An increase of vacuum was, however, associated with a lower temperature of the condensate, but even at the highest vacua there is usually sufficient exhaust steam from the auxiliaries to raise the condensate to a temperature suitable to the economisers. The cost of obtaining a high vacuum due to size of condensers and quantity of cooling water required was also considered. The most economical conditions in power stations were usually to have a vacuum of about 29½ ins. with 50° F. cooling water and circulating water 65 times the steam condensed, and 28 ins. at 80° with 70 times further increased in the quantity of cooling would need pumps of disproportionately greater size.

**German Trade in Belgium.**—British manufacturers desiring to make arrangements for being represented in Belgium in the future are invited to apply to the Belgian Chamber of Commerce in London (24 St. Dunstan's Hill, E.C.), who have the names of a number of good-class refugees who, before the war, acted for German firms, and are wishful to replace these makers by English manufacturers of similar goods. Employers who have vacancies for foreign correspondents, &c., are also invited to communicate with the Belgian Chamber of Commerce.

**The Society of Engineers.**—At the annual meeting on December 14th, among the awards announced was the President's gold medal to Mr. A. S. E. Ackermann, for his paper on "The Utilisation of Solar Energy." The following officers and council were elected for 1915:—President, N. Scorgie; Vice-Presidents, P. Griffith and H. C. Adams; Members of Council, H. Adams, C. T. Walrond, S. Cowper-Coles, B. H. M. Hewett, F. H. Hummel, G. A. Becks, F. L. Ball, W. B. Eason, G. O. Case, and W. N. Twelvetrees; Associate Member of Council, C. E. May; Hon. Secretary and Hon. Treasurer, D. B. Butler.

**Royal Institution.**—Among the Friday evening discourses before Easter will be one by Dr. Dugald Clerk, F.R.S., on "Gaseous Explosions"; on Jan. 29th, one by Prof. A. W. Crossley, F.R.S., on "Science and Industrial Problems," and one by Prof. Sir J. J. Thomson, F.R.S., on "Experiments in Slow Cathode Rays."

## NEW 6,000-KW. TURBO-ALTERNATOR AT LIVERPOOL

A NEW 6,000 kw. steam turbo-alternator has been "inaugurated" at the Lister Drive station of the Corporation of Liverpool, and is the largest set in the works. The opportunity was taken to inspect the whole generating plant, and the ceremony of starting the new set was performed by the chairman of the Electricity Committee in the presence of the Lord Mayor of Liverpool and a large company who afterwards dined together at the Adelphi Hotel.

The new set is of entirely British manufacture, and was built and supplied by the British Thomson-Houston Co., Ltd. (Rugby), whose contract also included the supply of the condensing plant, manufactured by the Mirreles Watson Co., Ltd. (Glasgow). The Corporation has at the present time another similar set on order, and the station has been altered so as to accommodate two more similar sized sets. When completed the capacity of the No. 1 station will be 35,000 kw., made up of two 2,000 kw. Westinghouse D.C. turbo-generators, two 3,500 kw. B.T.-H. turbo-alternators, two 6,000 kw. B.T.-H. turbo-alternators, and two 6,000 kw. sets not yet ordered. In the No. 2 station are installed four 2,000 kw. Westinghouse turbo-sets and six 2,000 kw. Curtis

valves which open and close successively. The oil pressure for the controlling piston is obtained from the lubrication system. An arrangement is provided by which the speed may be adjusted by hand 5 per cent. above or below the normal rated speed while running. The governing is within  $2\frac{1}{2}$  per cent. total variation between no-load and full-load, and the momentary variation in speed when full-load is thrown on and off is 5 per cent. A safety governor is also provided consisting of an unbalanced steel ring held by means of a helical spring concentrically to the turbine shaft as long as the speed of the shaft remains normal. Should the speed exceed  $12\frac{1}{2}$  per cent. above normal speed, the centrifugal action will overcome the spring and cause the ring to fly over into an eccentric position. In this position it will strike a trigger and thereby allow the emergency valve to close. This valve can also be operated by a hand-tripping arrangement.

The alternator has a cast-iron stator frame all in one piece provided with removable inspection panels. The stator core plates are insulated on both sides with a hard enamel. High tensile steel discs are used for the rotor. The machine is provided with double end shields, and air is drawn in between them from the space below the base plate. This ventilating current divides into two parts—the first part is drawn in through the rotor, and by means of the ducts provided ensures

6,000-KW. B.T.-H. TURBO-ALTERNATOR AT LIVERPOOL.

vertical B.T.-H. sets. The stations are under the charge of Mr. H. Dickinson, City Electrical Engineer, who is responsible for the arrangements of the extensions.

The turbine driving the new sets is of the horizontal shaft type, running at 1,500 r.p.m., and is designed to take steam at 200 lbs. per sq. in. superheated 200 deg. F., and to exhaust into a 28-inch vacuum. The normal rated output of the set is 7,500 k.v.a. at 80 per cent. power factor, 6,600 volts, three phase, 50 cycles, for six hours with a temperature rise not exceeding 40 deg. C. (with intake air not above 25° C.). The overload capacity is 25 per cent. at 80 per cent. power factor for two hours, and the alternator is specially designed to withstand a short circuit with the minimum amount of mechanical strain. Among interesting points in the design of the turbine are the use of carbon ring steam sealed glands, the completeness of the forced lubrication system and the governing arrangements. The governor is driven by worm gear from the main turbine shaft. It is of the centrifugal type, and is carried on the same vertical shaft as that driving the oil pump. It controls a small hydraulic pilot valve which admits oil at a pressure of about 60 lb. per sq. in. on either side of a rotary piston attached to the cam shaft which operates the steam-controlling valve. This admits steam to a small group of nozzles with several controlling

that the exciting windings are thoroughly cooled; the other portion is impelled against the stator and windings by means of carefully designed fans fitted to the ends of the rotor. The air which escapes from the rotor also passes through these same ducts, but by means of separate channels, so that the two streams of air do not in any way interfere with one another. A large opening is provided at the bottom of the stator frame, which allows the air to pass out into the exit duct, or it can be led off into the engine room by means of an opening in the top of the stator frame. The hot air leaving the machine may be conducted to the stoke hold so that some portion of the energy lost in the generator may be recovered in the boiler plant. The quantity of air needed for cooling the generator amounts to about 25,000 cubic ft. per min., this quantity being circulated by the fans provided on the rotor. A direct-coupled four-pole exciter with interpoles is provided.

The condensing plant is capable of dealing with 88,000 lb. of exhaust steam per hour, and maintaining a vacuum at the turbine exhaust branch of 28 in. (Bar. 30 in.) when supplied with 11,000 gallons of cooling water per minute at a temperature of 80° F. The condenser is of special design, and contains 14,000 sq. ft. of cooling surface. The air pump is of the Mirreles-Leblanc rotary type running at a speed of

2,000 r.p.m., and capable of dealing with 95 lb. of air per hour. The circulating pump is of the centrifugal type, specially designed for high speed, and is capable of dealing with 11,000 gallons of water per minute against a head external to the condenser of 40 ft. The centrifugal water-extracting pump is coupled to the same spindle as the air pump, and is capable of drawing the water of condensation from the condenser and delivering it against a head of 16 ft. above the pump centre. These three pumps are all mounted on one spindle and driven at 2,000 r.p.m. through flexible coupling by a three-stage steam turbine exhausting into the main condenser.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,422.

Describe a workshop method of testing the permeability of dynamo yokes after machining. The diameter of yoke is about 20 in., and the test is required to show whether the yoke is homogeneous.—S. K.

(Replies must be received not later than first post Monday, Jan. 4th.)

### ANSWERS TO No. 1,420.

What are the modern methods employed to protect consumers on the L.T. sides of transformers from accident due to high voltage?—"UNITE POLE."

The first award (10s.) is given to "J. I. E." for the following reply:—

We will consider first the case of a transformer supplying a low-tension A.C. system. There are three methods of protection which are in general use:—(a) The neutral point earthed either direct or through a resistance; (b) a copper shield between high- and low-tension windings; (c) an electrostatic device connected to the low-tension windings. The first method is perhaps the one most generally in use, and so long as the earth is in good order, affords perfect protection. The transformer, of course, must be star-wound. With this arrangement an earth on one line means a dead short on one phase, and it may be advisable to introduce a resistance between the transformer winding and earth in order to limit the short-circuit current. When dead earthed, the maximum potential above earth will not exceed the low-tension voltage, but with a resistance introduced the maximum potential will be greater, depending on the amount of resistance. The second method consists of a protecting shield placed between the high-tension and low-tension windings, and connected to earth. It has several disadvantages. In order to be a real safeguard the copper must be of appreciable thickness, otherwise a breakdown might burn a hole in the shield and thus allow the high potential direct access to the low-tension windings. Unfortunately, the greater the thickness of the shield, the less satisfactory is the transformer, so far as efficiency, heating, &c., is considered. Also, repairs, if necessary, to the earth shield are somewhat troublesome. For these reasons this method of protection is not so much

used now. The third method embraces the Cardew and similar devices. In one modern make this takes the form of two circular brass plates fixed one above the other, with a gap of about  $\frac{1}{4}$  in. A piece of aluminium foil is fixed by one end to the lower plate, which is connected to earth. The upper plate is connected to the transformer winding. As the plates are at different potentials, the free end of the aluminium foil is attracted to the upper plate, the force of attraction depending on the difference of potential. The distance between the plates can be adjusted so that if the low-tension winding becomes accidentally charged above a certain voltage, say 500, the aluminium foil makes contact between the two plates, thus permitting the excess charge to flow to earth. The whole arrangement is mounted inside the transformer case. Many transformers are now in use with rotary converters supplying D.C. systems, and the protection of such systems may now be considered. The rotary may be arranged to give 3-wire for lighting or 2-wire for traction, or may be arranged to give either as required. In the former case the mid-wire of the system is usually earthed, and in the case of traction the negative is earthed by the rails. When the machine is running, the low-tension windings are metallically connected to the D.C. system through the armature of the rotary converter, so that it will not be possible to get a dangerously high potential on the D.C. side in case of a breakdown in the transformer. However, if the converter is disconnected from the bus-bars, then there is no protection for the set. If the set is used for lighting only, then any of the three methods discussed above could be used, but if the set is to be used for traction, only the second and third methods are available, as earthing the neutral of a transformer with the negative D.C. earthed would cause a short. Where converting sets are concerned, the electrostatic method of protection seems to be most used.

The second award (5s.) is made to "Quis," who writes as follows:—

The standardisation of modern transformer design does not, as a rule, provide for protection against the occurrence of faults between high- and low-tension windings. Instead of embodying a safety device in the construction of the transformer, it is considered sound practice, in view of the improved consistency and reliability of insulating materials, to allow for and depend upon an ample factor of safety in this respect. Taking as an example a transformer intended for operation at 2,000 volts on the high-tension side, the practice of one of the principal British manufacturers is to require that the winding shall stand up against 7,000 volts to frame and between windings, applied for one minute immediately after the transformer has been taken off its heat run. In the event of a customer requiring additional protection, however, two methods are available as an integral part of the transformer and one as an auxiliary to a large installation. Of the former, the first consists in the provision of earth shields between the windings. As the name implies, the shields take the form of sheets of copper foil disposed between the windings and earthed to the frame. In the case of sandwich-wound shell-type transformers—and it is to this type that earth-shields are best adapted—the sheets are rectangular in shape, with rounded corners and a similar hole in the centre. In the case of concentric-wound core-type transformers, the form is that of a concentric cylinder. In both types, of course, it is necessary to slot the shield in such a way as to prevent its constituting a short-circuited winding. The provision of earth-shields does not add considerably to the cost, as the same frame would be used in either case; but a slight sacrifice in efficiency is entailed, owing to the space occupied by the shields and the extra insulation. The second method of protection is by the use of Cardew's earthing device. A flat cylindrical brass box, the top and bottom of which are insulated from each other, contains a leaf of corrugated aluminium foil. The bottom is connected to the frame—and so to earth—and the top to one terminal of the low-tension winding. The electrostatic attraction at the normal voltage is without effect, but should a fault occur between high- and low-tension windings, the aluminium leaf is attracted, earths the high-tension side, and so, as when earth shields are employed, isolates the transformer either by blowing the high-tension fuses or by tripping the circuit-breaker. The device is convenient, in that it can be added at any time and to otherwise standard transformers. But mounted as it is within the transformer tank—though, of course, above the oil level—there is at least the possibility that it will stick, due to the presence of a film of oil, at just the moment when it is called upon to operate. The third method, though not an integral part of the transformer, has much to recommend it; indeed, in the case of heavy

service or extra high-tension transformers, it is the only feasible method. It consists in the suitable application of the Merz-Price protective system. A fault between high- and low-tension windings can be arranged to isolate the particular transformer affected without disturbing those operating in parallel; while incidentally the same apparatus may be caused to isolate the transformer in the event of an earth on one phase or a short between turns.

### CAMP LIGHTING

ONE of the directions in which the war has given special work to the electrical industry is in the lighting of the numerous camps which have been formed for the Regulars and Territorials in various parts of the country. Last Monday, at Gailles, near Glasgow, the light was switched on in two large contiguous camps established for the two battalions of 1,100 men each, which have been raised by the Glasgow Corporation. The camps consist of 80 ordinary huts, 27 huts for officers' quarters, and also guard-rooms, dining-rooms, baths, cooks' houses, regimental institute, and a rifle range for each battalion. There are in all about 1,200 lamps, and the area covered by the camp is about 500 by 250 yards. The order for the lighting of the camps was given only on Nov. 15th, so that the work has been extremely rapid.

Current is taken as a tapping from one of the Glasgow Corporation's 11,000-volt feeders, which passed conveniently about 240 yards away. A 25-kw. transformer converts the current to 240 volts, and the wiring is converted direct on to the three-phase secondary. An underground cable connects the transformer to the first hut, and thence the wiring between the huts is overhead with 200-megohm grade wire-on insulators. It was deemed advisable to use lightly-insulated instead of bare wire to guard against the danger of short-circuits.

### THE ASSOCIATION OF SUPERVISING ELECTRICIANS

THE Proceedings of this Association for next year will commence with the half-yearly meeting and informal discussion on Jan. 19th. The following Papers are also announced:—"Intercommunication Telephones," by H. S. White (Feb. 23rd); "D.C. Motors," by E. F. Butler (March 30th); and "Lightning Conductors," by H. C. Hands (April 27th). The Annual General Meeting is fixed for May 25th.

At the last meeting, on Dec. 15th, a Paper on "Wiring Systems," by Messrs. C. J. Banister and C. R. Bates, was discussed. Some other interesting Papers have been read, and we have received copies of them and reports of the discussions from the Secretary, Mr. C. J. Banister (14 Pulborough Road, Southfields), from whom all information as to the Association can be obtained.

In the first Paper of the Session, on Sept. 29th, Mr. A. H. Dykes reviewed the subject of private generating plants, emphasising the importance of ample battery capacity, and recommending that where the engine-room was far from the house it was better to have the battery at the house rather than at the engine-room. After a few words on the estimation of water power, he compared the different types of engine available, preferring the oil engine to either steam or suction gas plants for intermittent work. Among the simplest were the hot bulb paraffin engine and the "semi-Diesel," but these engines required to be worked on a fairly steady load, and were not well adapted for running on very varying loads.

Another interesting Paper was that by Mr. H. C. E. Jacoby on "Single-Phase Commutator Motors," read on Nov. 10th. In this he described a motor of his own design, known as the "Bandy" motor, in which the speed is automatically controlled by a centrifugal governor, which shifts the brushes, and a handwheel is provided to vary the speed at which this acts. Such a motor is very suitable for lift work. Various other methods of speed variation were referred to and a method of electrical braking was described involving fitting the armature with slip-rings which could be short-circuited when required.

**Metal Filament Lamp Litigation.**—The action by the B.T.H. Co. against Duram, Ltd., for alleged infringement of their metal filament lamp patents, was in the Appeal Court list on Thursday in respect of an appeal by the plaintiffs against an order by Mr. Justice Neville granting "discovery" of their books. There were, however, several other cases in front, and the appeal will go over until next sittings.

### REVIEWS OF BOOKS

**Fuel: Solid, Liquid, and Gaseous.** By J. S. S. Brame. 372 pp. 9 in. by 6 in. 73 figures. (London: Edward Arnold.) 12s. 6d. net; abroad, 13s. 2d.

When it is remembered that in a modern power station of large size the fuel costs are from 50 to 65 per cent. of the total generating costs, the importance of fuel to an electrical engineer cannot well be over-estimated. The volume before us treats of fuel in a clear manner; its fault is that it is somewhat academic manner, and practical questions such as comparative costs and reliability of working do not always receive due consideration.

Solid fuels are dealt with in some 160 pages, and reference is made to all ordinary solid fuels. The storage of coal is shortly treated, and the question of wet or dry storage is considered. It is now the generally-accepted opinion that storage in considerable bulk for long periods can only be done safely under water, whereby all risk of oxidation and spontaneous combustion is avoided. The coking of coal is considered at some length, and a brief reference is made to by-product recovery, but such recovery is being adapted upon a much larger scale than the author indicates.

Oil fuels for firing boilers as apart from internal combustion engines are fully treated, and most of the atomisers on the market are illustrated and described. The author does not make it clear, however, that, for equal evaporation, the cost of oil fuel is double that of coal at current prices. The fascinating problem of surface combustion is shortly given, and there is little doubt that it is destined to play an important part in economic steam production. Already a nett efficiency of 90 per cent. has been obtained. The commercial combination of gas producers, ammonia recovery plant, and surface-combustion boilers offers the possibility of reducing fuel costs by some 25 per cent., without allowing for any possible increase in turbine efficiency due to higher superheat.

It is of interest to note that one Board of Trade unit is equivalent to 3,400 B.Th.U., but yet, with good modern turbine plant and with efficient boilers, it is necessary to expend 30,000 B.Th.U. under the boiler to obtain one unit of electricity, i.e., the efficiency of conversion is only 11½ per cent. The scientific purchase of coal on a heat and ash basis is given in Chapter XIX., and two examples are set out; in view of the importance of such purchase, more modern examples might have been cited and at greater length.

On the whole, the book is well and carefully written, and is one to recommend to engineers interested in steam generation.

**Photo-Electricity.** By A. L. Hughes. 144 pp. 8½ in. by 5½ in. 40 figures. (Cambridge: The University Press.) 6s. net; abroad, 6s. 4d.

In this work are set forth the results of recent research on the effects of light on electrical phenomena, more especially the influence of gases ionised by light upon the discharge of electricity from conductors. The subject is handled very fully, and it will be a great convenience to those interested in this branch of physics, which, besides its theoretical importance, is not without interest in connection with the effect of sunlight on wireless telegraphy, to have the work of many investigators brought together into a connected account.

**India Rubber Laboratory Practice.** By W. A. Caspari. 196 pp. 7½ in. by 5 in. 25 figures. (London: Macmillan & Co., Ltd.) 5s. net; abroad, 5s. 4d.

The perusal of this book by users of electric cables will tend to make them very uneasy. The practices—and factices—used in manufacturing rubber are described; the list of materials, other than rubber, employed in manufacturing vulcanised rubber is appalling, and the methods of detecting too liberal a use of these are sometimes difficult. In his book, which is evidently written as a result of long experience in the testing of rubber, both during and after manufacture, the author deals with the subject with extraordinary frankness. We should welcome a companion volume dealing specifically with india-rubber for electric cables, and telling the buyer of these what are the best general means to employ, other than laborious, difficult, and sometimes inconclusive laboratory tests, to discriminate between good and bad rubber from the point of view of durability and maintenance of its physical properties.

**The Year Book of Wireless Telegraphy and Telephony.** 1914. 744 pp. 8½ in. by 5½ in. 32 figures. (London: Marconi Press Agency, Ltd.) 2s. 6d. net; by post, U.K., 2s. 11d.; abroad, 3s. 6d.

This very comprehensive year book has increased in size considerably since last year's issue. The interesting chronological record with which it opens has been extended in both

directions to include earlier researches and recent developments. The reference sections of the volume dealing with the rules and regulations in force in various countries, and the list of land and ship installations have also been much enlarged, and a very complete list of call signals is given. The series of special articles is also somewhat different from those of last year, and includes:—Waves and Wave Motion, by Prof. J. H. Fleming; the Juncture of the Atmosphere in Transmission, by Dr. J. Erskine Murray; The Measurement of the Strength of Wireless Signals, by Prof. E. W. Marchant; Problems of Wireless Telephony, by C. E. Prince; Wireless Telegraphy in the Merchant Service, by G. E. Turnbull, and other articles on wireless telegraphy in life-saving, meteorology, and time signals, followed by some notes by Dr. Eccles on the work of the British Association Committee. Glossaries of technical

terms and much other useful data complete a valuable volume of reference.

**The Motor Manual.** 266 pp. 7½ in. by 5½ in. About 250 figures. (London: Temple Press, Ltd.). Seventeenth edition. 1s. 6d. net; by post 1s. 9d.

The seventeenth edition of this popular work has been thoroughly revised, and contains a mine of useful, practical, and reliable information to the motor-car user. The ignition section has been brought up to date, particularly as regards modern patterns of magneto, and as befits the advances in the subjects, automatic engine starters and electric lighting are more fully treated than formerly, with the aid of many excellent new illustrations. It is not every work of this kind that is kept as thoroughly abreast of modern practise as this.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Dec. 17th, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

26,546/13. **Heating Elements.** E. B. COX. The resistance is in the form of a strip wound on, but insulated from, a metal tube, and is enclosed in a watertight space between it and an external sheath, from which it is also insulated. Connection is made by good conducting material wound over the ends of the coil, and terminal wires are brought in through internal tubes sealed so as to be watertight. The outer metallic covering is formed by winding on strip and afterwards making this continuous by electro-deposition or spraying of metal. (Three figures.)

27,480/13. **Wireless Telegraphy.** MARCONI'S WIRELESS TELEGRAPH CO., LTD., and H. J. ROUND. A method of eliminating atmospheres which cannot ordinarily be tuned out by using a receiving circuit slightly out of tune with the signal waves, so that the induced free and forced oscillations are of suitable relative frequency to produce beats. These beats are rectified, and the detecting circuit is tuned to their frequency. (Three figures.)

29,245/13. **Telephony.** S. G. BROWN. A bridge method of connecting telephones with the object of preventing the speaker's voice and other local sounds from being reproduced in his receiver and disturbing him. The receiver is connected across a resistance divided into two parts by a connection to the transmitter, while an artificial line of suitable electrical constants is placed between one end of the resistance and the line in parallel with the transmitter. (One figure.)

3,328/14. **Cable Grip.** ST. HELEN'S CABLE & RUBBER CO., LTD., and J. C. WHITE. A method of taking the stress of the conductors of a flexible cable covered with whipcord or other sheathing. A tapered annular plug is driven in axially under the sheathing, the expanded portion bearing against the cover of the plug or outlet box. (One figure.)

10,868/14. **Condensers.** G. GILES. The electrodes are formed by layers of lead applied in such a way as to combine with the surface of the glass.

17,465/14. **Train Control.** N. W. STORER. A control system for high-tension D.C. railways, in which a storage battery for supplying energy to auxiliary apparatus at certain times is connected in series with the main motors when they are receiving current, the main current being shunted through the auxiliary apparatus when required. (Three figures.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.\*

Summaries of some of the more important of these Patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** A. G. BROWN, BOVERI ET CIE [Insulators] 27,734/13; B.T.-H. CO., WHITAKER and WEDMORE [Distribution systems] 29,984/13.

**Dynamos, Motors, and Transformers:** B.T.-H. CO. and WHITAKER [Starting synchronous machines] 4,559/14; GRAEMIGER [Motors and clutches] 8,699/14.

\* It is announced that from Jan. 1st, 1915, the price of printed specifications will be 6d. each, including inland postage, instead of 8d. as at present.

**Electrometallurgy and Electrochemistry:** HÄRDÉN [Furnaces] 570/14.

**Switchgear, Fuses and Fittings:** HOLT and MÖLLER [Circuit breakers] 23,247/13; B.T.-H. CO. (G.E. Co., U.S.A.) 29,662/13; ELLISON and JONES [Switches] 29,822/13; IRRIGAN ELECTRIC CO. (Cutter-Hammer Mnf. Co., U.S.A.) [A.C. control apparatus] 8,957/13.

**Telephony and Telegraphy:** MILLER [Production of oscillations] 20,806/13; MARCONI'S WIRELESS TELEGRAPH CO. and RYAN [Wireless control of valves] 23,340/13; AUTOMATIC TELEPHONE MANUFACTURING CO. and SPERRY [Telephone systems] 25,780/13; FREEMAN [Cable-laying apparatus] 26,447/13; WESTERN ELECTRIC CO. (Woodward for W.E. Co., U.S.A.) [Ring-off relays] 28,159/13; SHEPARD and McKECHNIE [Wireless telegraphy and telephony] 1,169/14.

**Traction:** BETHENOD [Car-lighting dynamos] 27,945/13; WADSWORTH [Combined starters, dynamos and ignition timers] 1,174/14; SOC. D'ELECTRICITÉ MORS [Railway signalling] 2,741/14; B.T.-H. CO. (G.E. Co., U.S.A.) [Car-lighting system] 5,019/14; BARDSLEY [Tramcar brakes] 5,377/14; BROOKS and HOLT [Car lighting] 8,855/14; MULLANEY [Traversers] 10,619/14.

**Miscellaneous:** PULLIN [Electromedical apparatus] 26,273/13; BARR, STROUD and FRENCH [Transmission of observations] 28,125/13; ROSS and SCHOFIELD [Electrostatic apparatus] 1,757/14; GEUGENBACH [Ironclad electromagnets] 11,492/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Switchgear:** GEH. JAEGER [Tumbler switches] 29,341/13; SIEMENS SCHUCKERTWERKE GES. [Switches] 18,502/14.

**Traction:** SOC. DES ÉTABLISSEMENTS L. BLERIOT [Car lighting] 23,075/14.

### Opposition to Grant of Patents

22,331/13. **Lamp Filaments.** C. O. BASTIAN. Opposition has been entered to a grant on this specification, which describes helically-wound drawn wire filaments in which the wire is provided with a coating during preparation to keep the convolutions apart. This coating is removed after mounting the filament.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

25,774/00. **Number Sign.** W. JOHNSON and J. MAKIN. Electric signs in which changing numbers, such as are required in programme indicators, are formed by lighting combinations out of a group of lamps by means of a drum-type controller.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** F. J. GREEN [Clutch arc lamp] 19,110/02; C. O. BASTIAN [Mercury vapour lamps] 18,624/03.

**Dynamos, Motors, and Transformers:** F. PICHLER [Air-cooling vanes for transformers] 17,664/01; A.E.G. (Berlin) [Cooling of generators] 19,259/06; B.T.-H. CO. (G.E. Co., U.S.A.) [Transformer cores] 19,548/06.

**Electrochemistry and Electrometallurgy:** H. SCHMIDT [Electrolysis] 18,480/07.

**Switchgear, Fuses, and Fittings:** M. B. FIELD and FERRANTI, LTD. [Solenoid-operated oil switches] 17,699A/05; A. WHITE [Switches] 19,708/07.

**Telephony and Telegraphy:** P. M. JUSTICE (Millet Signal Co., U.S.A.) [Microphone for detecting vibrations] 19,911/09.

**Traction:** SIEMENS & HALSKE A.G. (Berlin) [Working of signals and points] 10,778/06 and 16,164/08.

**Miscellaneous:** W. J. POOLE [Magnetic clutches] 19,738/07.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

At the Royal Society, on Dec. 3rd, Mr. de Lange described a "thermophone," which he had devised in conjunction with Mr. Otto Fischer. In the original Preece platinum wire instrument dating back to 1880 the wire was connected to a membrane. Seven years ago Gwodz (in some experiments made near the now famous town of Lodz) made a thermo-telephone without a membrane or electromagnet by placing a Wollaston wire in an insulating medium and treating the wire with acid, but the volume of sound obtained was small. About the same time Prof. Abraham, of Paris, used a thin, straight platinum wire between electrodes. Mr. de Lange fixes a platinum wire of a diameter of from 2 to 12 microns in a Gothic curve, and claims to have made a thermophone of "practical, everyday use," because the silver of the Wollaston wire is eliminated, and the whole Wollaston wire is suspended in the acid in such a way that such part of the wire can be set free as is considered desirable. It is necessary to enclose the instrument under a thin metal cover with one or more small openings, and surrounded with some cooling substance. The cover acts as a resonator. The sound is conducted through a small rubber tube.

At a meeting of the Wireless Society of London, at the Institution of Electrical Engineers last Friday, Prof. G. W. O. Howe delivered a lecture on "High Frequency Resistance of Wires and Coils." He dealt with the subject from the point of view of applying the so-called telephone transmission formulæ. He showed mathematically how it was possible to calculate the current density in a flat conductor for very high frequency at any point and at any depth in terms of the current density on the surface, whilst the method could also be applied to calculating the resistance of the earth to wireless waves sent out from an antenna. With a round conductor the formulæ were equally applicable so long as the penetration was not very deep. In other words, the formulæ applied if the penetration did not exceed one-third of the radius of the wire. He has found this method gave the same results within a very small error as are obtained by means of Lord Kelvin's formula. It could also be applied to steel rails used on single-phase railways as the return. Permeability came in, which was rather uncertain; it depended upon the magnetisation and differed from point to point, but with a frequency of 50 cycles, a specific resistance of the steel of 20 microhms, and a permeability of 1,000, the penetration into the rail was of the order of 1 to 1½ mm. With a frequency of 25 the penetration was nearly 2 mm. With round wires and low frequency, the telephone transmission formulæ was not applicable. This problem, he said, had claimed the attention of leading mathematicians for the last few years, viz., the resistance to alternating current of a coil or round wire, and the results had been very divergent and unsatisfactory. None of the results could be relied upon, and there was room for much experimental research work. Capacity currents came in and made it very difficult to measure the resistance with very great accuracy. Mr. W. Duddell, F.R.S., in the brief discussion which followed, said he believed the character of the insulation was largely responsible for the varying results obtained upon the resistance to alternating current of a coil or round wire.

The use of high-speed printing telegraph apparatus is now used to a considerable extent in daily newspaper offices, and it is satisfactory to learn from a brochure that we have received from Creed, Bille & Co., Ltd. (Felsdon Road, Croydon) that it is a British system which has solved the difficulties formerly encountered. A German system was at one time experimented with by the Post Office, but was afterwards withdrawn, and the Creed system, in addition to its newspaper work mentioned above, has been working uninterruptedly on the Edinburgh-London circuit for six years, and during the past few months it has been installed at Glasgow, Manchester, Liverpool, Birmingham, Grimsby, and elsewhere with highly satisfactory results. A "Kleinschmidt" perforator with a typewriter keyboard is used. The strip from this is passed through the transmitter, and the receiver automatically punches a similar strip either by the "Creed" electro-pneumatic receiving perforator or the "Bille" electric motor-driven apparatus. This second strip is passed through the Creed printer, which delivers the message in printer characters on a paper tape. Another instrument of the series is the Creed telegraph translator, which produces from a Creed strip another strip perforated with signals as used for automatic transmission on cable circuits.

### ELECTRIC TRACTION NOTES

The L.C.C. engineers at Greenwich were extremely prompt in their work in reinstating the supply after the accident described in our last issue. Work was taken in hand as soon as the plant was cool enough to handle, and one generator set was connected up and running within twelve hours. The remainder were replaced at the rate of one a day, and all were at work within a week of the shut down with permanent cable connections, and the two reciprocating sets (of which a few stator coils had been burnt out owing to the absence of protective reactances) were also fully repaired by that time. While these repairs were proceeding, a restricted car service was run through supply obtained from the London Electric Supply Corporation, the London United Tramways Co., the Leyton Urban District Council, and the West Ham Borough Council. A special cable was connected from the St. Pancras station to a local L.C.C. sub-station, and supply was given in this way on the Sunday following the accident. At the meeting of the Council on Tuesday, Sir John Benn moved that a Special Committee of seven be appointed to inquire into the circumstances of the breakdown, and as to what should be done in future. He alleged that it was due to the refusal of the Council to adopt the suggestion of the Progressives to build a second power house as a standby. Mr. G. Hume, Chairman of the Highways Committee, said the matter was being made a party question, and he would not agree to a Committee to inquire into the whole tramway policy of the Council. The resolution was defeated by 42 votes to 32.

There is a prospect of the Brighton and Hove Corporations discussing the relative merits of the under- and over-running trolley omnibus systems in order to avert arbitration as to the system to be adopted on the through routes.

The subject of audible and other cab signalling on railways was discussed at a meeting of the Institution of Mechanical Engineers last Friday. The general principles were dealt with in a Paper by Mr. W. C. Ackfield (Midland Railway), who thought it unlikely that a purely mechanical system could be designed suitable for general railway service, but looked forward to a successful electrical or electro-mechanical system. Mr. V. L. Raven described his system, which has been in use on certain sections of the North Eastern Railway for over two years, and is fitted to 36 locomotives. This is a purely electrical system, and in its essentials was described in a Paper before the Institution of Electrical Engineers a few years ago (see *ELECTRICAL ENGINEERING*, Vol. II., page 935, Dec. 12th, 1907). A further Paper by Mr. W. A. Stanier described the combined audible train control and audible signal systems in use on the Great Western Railway (see *ELECTRICAL ENGINEERING*, Vol. I., pages 341, March 7th, 1907). The last Paper, by Mr. W. Willox, described the all-electric train stop used on the electrically-worked section of the Metropolitan Railway.

The electrical working of the 113 miles of the Chicago, Milwaukee & St. Paul Railway, for which the contract has just been placed, presents several points of interest. According to the *Electric Railway Journal*, overhead conductors are to be used with a contact line pressure of 3,000 volts D.C. with flexible catenary construction and pantograph collectors. Power will be supplied to the four sub-stations (which will be equipped with synchronous motor-generators) at 110,000 volts three-phase 60 cycles from water-power stations of the Montana Power Co. Very large and powerful locomotives will be used, constructed in two permanently-coupled units, each having eight driving wheels and a four-wheeled bogie at the end. The driving axles are arranged in pairs upon a series of four articulated trucks, two under the main frame of each unit. Each driving axle is twin-gear to a 375-h.p. (continuous-rating) motor, and the motors are permanently connected in pairs in series. The whole vehicle weighs 260 tons, of which 200 tons is available for adhesion, and the starting draw bar pull will be 80,000 lb. The passenger locomotives will haul an 800-ton train at 60 m.p.h. on the level, and the goods locomotives will haul a 2,500 train up a 1 per cent. gradient at 16 m.p.h. The control provides for regenerative braking. The plant and locomotives are being supplied by the General Electric Co. of America.

**Crystal Palace School of Practical Engineering.**—The 126th award of certificates and the usual inspection of the school took place last Thursday. Sir Francis Fox was in the chair, and Sir David Burnett and other trustees were present.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**METAL FILAMENT LAMPS.**—A leaflet from L. Andrew & Co. (2 Whitworth Street West, Deansgate, Manchester) gives prices of "Wrendal" British-made metal filament lamps.

**CHRISTMAS PRESENTS.**—A list from the Edison & Swan United Electric Light Co., Ltd. (Ponders' End, Middlesex, and 123-125 Queen Victoria Street, E.C.) collects together a number of their manufactures of an electrical nature suitable for Christmas presents, such as radiators, table lamps, vacuum cleaners, electric kettles, hot plates, irons, etc.

**SWITCHES AND FUSES.**—A collection of new leaflets from Ferranti, Ltd. (Central House, Kingsway, W.C.), deal with knife switches, isolating switches, ironclad switches and fuses, combined interlocked ironclad switch and fuse panels, low-tension and high-tension switchboard type tubular fuses of several types, including fuses for potential transformers and liquid resistance protectors for electrostatic instruments.

**RADIATORS.**—A new type of electric fire with a glowing coiled wire heating element arranged zig-zag between porcelain bars is also described in leaflets from Ferranti, Ltd. These are made up to 3 kw.

**POCKET WAR MAPS.**—Drake & Gorham, Ltd. (66 Victoria Street, Westminster), have brought out a very convenient little booklet containing miniature coloured maps of the war districts of France, Russia, Austria, and Serbia, and at the same time calling attention to some of their many electrical specialties.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**RADIATORS.**—An attractive form of 600-watt glowing coil radiator with reflector is illustrated on a postcard from Haylock & Haslett (63 Queen Victoria Street, E.C.).

**ELECTRICAL SUPPLIES.**—Leaflets from Krupka & Jacoby, Ltd. (39 Victoria Street, S.W.), deal with radiators and accessories of British manufacture and cables of Dutch manufacture.

**INTERCOMMUNICATION TELEPHONES.**—An interesting booklet, entitled "Time is Money," from the Western Electric Co. (North Woolwich), sets forth the advantages of the use of intercommunication telephones in large business houses.

**CABLES AND WIRES.**—A new list of "Silvertown" gutta-percha, indiarubber, silk, and cotton covered wires, jointing tools and materials, has been issued by the India Rubber, Gutta Percha and Telegraph Works Co., Ltd. (100-106 Cannon Street, E.C.).

**VACUUM CLEANERS.**—The Electric Suction Cleaner Co. (151 Queen Victoria Street, E.C.) have issued an attractive booklet with coloured illustration setting forth the many good points of their "Frant Premier" electric vacuum cleaner, which is of the self-contained type, with high-speed motor and fan built into the body of the machine, and a revolving brush within the nozzle.

### CALENDARS, &c.

The wall calendar of the United States Metallic Packing Co., Ltd. (Soho Works, Bradford, Yorks), is always an artistic production, and this season bears an embossed representation of a piece of statuary by Lanson named "L'Age de Fer."

A distinctly novel note is struck by the decoration of the daily tear-off calendar which we have received from Pirelli, Ltd. (144 Queen Victoria Street, E.C.). A quasi-Japanese scene thereon embraces a bridge made from a gigantic Pirelli tyre.

**Australia's Trade with Germany.**—The Commonwealth of Australia has issued a pamphlet on this subject giving various particulars regarding trade formerly carried on between Australia and Germany which should now be available for Britain. Tables are given of the exports from Australia to Germany during recent years, and of the imports from Germany, from which it appears that in 1913 £58,888 of electrical machinery, £76,133 of "electrical and gas appliances," £7,244 of telephones, £16,684 of "electrical materials," £16,684 of arc lamp carbons, and £56,450 of cable and covered wire were imported. An extensive list of Australian export firms is also given.

### BRITISH MADE WEATHER PROOF LANTERNS

**F**ITTINGS manufacturers in this country are, to a large extent, recovering from the inconvenience caused by the stoppage of supplies of vitreous enamelled material, a large percentage of which was formerly obtained from Continental sources, as English manufacturers found it difficult to produce vitreous enamelled articles, such as outside lanterns, at prices which would compare with those of their foreign competitors. Various methods have been adopted to combat this temporary dislocation of trade, and in many cases zinc or polished copper is being introduced in the place of

ENAMELLED IRON LANTERN FOR HALF-WATT LAMPS.

enamelled iron. Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston), send us some particulars of copper and zinc lanterns which can be supplied from stock. They are also in a position to supply an entirely British-made lantern for half-watt lamps in vitreous enamelled iron. The design of this lantern embodies many of the advantages claimed for the Continental type, and the cost is about the same. We give a section of the lantern above, showing the principal features of its construction.

### NEW HOLOPHANE GLASSWARE

**I**N these days of restricted street lighting it is more than ever necessary that those lamps which are utilised should give the greatest radius of illumination it is possible to

FIG. 1.—NEW HOLOPHANE GLOBE FOR OUTSIDE LIGHTING.

obtain, but with a subdued effect, avoiding all glare. Too many of the existing street lamps throw an intense light

over a small area immediately adjacent to them, whilst large spaces are left without any illumination.

In a pamphlet just issued, Holophane, Ltd., describe a new type of their well-known prismatic glassware which has been specially designed to carry out the requirements of a correctly installed street-lighting system. Hitherto mechanical difficulties have prevented the construction of a unit which, whilst embodying all the advantages of Holophane prismatic glassware, yet at the same time is smooth both on the outside and inside, so that undue accumulations of dust cannot collect, and also is easy to clean. These difficulties have now

FIG. 2.—LANTERN COMPLETE WITH NEW HOLOPHANE GLOBE.

been overcome by the new Holophane "Refractor" globe, which consists of two pieces of glass provided with horizontal and vertical prisms respectively, one piece being placed inside the other.

By the use of this globe the maximum light is sent out at an angle of  $15^\circ$  below the horizontal, and the intrinsic brilliancy of the filament is reduced whilst the absorption is practically negligible. The lamp is well protected from the weather, but the enclosing glass allows for ventilation, and is not a collector of dirt, and the cost of maintenance is small. A remarkably good distribution of light is obtained.

### "GENERAL ELECTRIC"

A VERY effective piece of Osram lamp advertising is to be found in the surprise envelope now being circulated by the General Electric Co., Ltd. On the flap of the envelope being opened the figure of the "General" springs into view

pointing to a few well-chosen words dealing with the merits of Osram lamps. The figure was designed by John Hassall. An inverted Osram lamp forms his headgear, head, and collar. As an epaulette he wears a tumbler switch, while he is also

decorated with the insignia of the Order of the "Magnet." The trembling-bell medals presumably symbolise his enemies' fear. The only mechanism consists of a piece of elastic band. In the envelope is a neat coloured folder, bearing a view of the Osram Lamp Works, Hammersmith, London, where 1,500 highly-skilled British workpeople are constantly employed, and giving prices of Osram lamps. The Company will be pleased to supply electrical contractors and dealers with these attractive envelopes, complete with name and address over-printed on the folder.

### AN ARC LAMP CARRIER

WE illustrate here a new pattern of "lyre" fitting for arc lamps, provided with lowering gear to enable the lamp to be trimmed from the ground, which has just been brought out by the London Electric Firm (George Street, Croydon). The entire absence of projections will be noticed, and also the unobtrusiveness of the contact-suspension gear.

No external winches or ropes are employed, and the gear further embodies a one-part device which performs a three-part function, viz., a contact-maker, a weight-reliever, and a lock for the canting inner harp, all performed simultaneously by one operation, thereby also ensuring safety, as the lamp cannot be lit until the weight is relieved from the rope and the harp is locked.

**Diesel Engine Users' Association.**—At the annual general meeting of this Association, at the Institution of Electrical Engineers, Mr. J. E. Edgcome was re-elected as President for the ensuing year. Messrs. F. H. Francis and Napier Prentice were elected as members of the Committee in place of the two retiring members. Mr. W. E. Brandreth was re-elected as Honorary Secretary, and as at the present time he is engaged on military duties, Mr. Percy Still was requested to act as Honorary Secretary during Mr. Brandreth's absence. Particulars were given in connection with a recent breakdown of a Diesel engine at Oxford, and an interesting discussion ensued. The subject is to be brought up again for the further consideration of the Association. It was announced that the general question of Diesel Engine Insurance against breakdown would be brought forward for discussion at the next meeting, which is to be held on Friday, January 15th, 1915. We are asked to state that any request for information concerning the Association and applications for membership should be addressed to the Acting Hon. Secretary, Mr. Percy Still, at 19 Cadogan Gardens, London, S.W.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Australia.**—The Sydney Corporation require transformer testing apparatus. Further particulars at 73 Basinghall Street, E.C., and tenders by March 15th, 1915.

**Belfast.**—The modified scheme of extensions ordered by the Corporation is estimated to cost £28,000.

**Birkenhead.**—Twelve months' supply of motors and motor-starters from  $\frac{1}{4}$  to 15 h.p. Borough Electrical Engineer. January 12th.

**Bolton.**—The Engineer is to report upon additional engine and boiler plant and switchgear required for the Back-o'-th'-Bank power station.

**Hong Kong.**—Two 1,500-kw. turbo-alternators with condensing plant and switchboards, E.H.T. cable, sub-station switchboards and transformers. Consulting Engineers, Messrs. Preece, Cardew & Snell, 8 Queen Anne's Gate, S.W. January 15th.

**Huddersfield.**—An expenditure of £20,000 upon plant extensions is to be incurred.

**London: Bethnal Green.**—The Finance Committee of the L.C.C. recommends the borrowing of £22,450 in connection with the supply in bulk to be taken. The amount includes:—Mains, £14,536; sub-station plant, £4,269; services, £500; meters, £300. We refer to the question of periods in "Local Notes."

**Hampstead.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £17,300 for electrical extensions, which includes £6,317 for mains, £8,583 for sub-station plant, and £1,928 for services.

**Stoke-on-Trent.**—Application is to be made for an additional loan of £12,230 for electrical extensions.

**Wolverhampton.**—Mains extensions for public lighting are contemplated at an estimated cost of £1,170.

### Wiring

**Belfast.**—Electric lighting of workhouse, Lisburn Road.

**Shrewsbury.**—Electric lighting at Belle Vue House, Trinity Street. Clerk to Guardians, St. John's Hill.

**Tunstall.**—Electric lighting of Bradwell Joint Hospital. Architects, A. R. Wood & Son, Tunstall.

### Miscellaneous

**Leeds.**—A 60-ton overhead electric travelling crane, and coal and ash conveying plant, is required for the Electricity Department. Manager. January 22nd.

**London: L.C.C.**—An expenditure of £12,725 is recommended upon cables, sub-station equipment, and cars for the reconstruction of the Burdett Road to Grove Road (Bow) tramways.—A motor is required in connection with the testing of electricity meters.

## TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

**L.C.C.**—The following tenders have been received for high- and low-tension switchgear for tramway sub-stations:—Johnson & Phillips, £1,177 19s.; Spagnoletti, £1,240 7s.; Ferguson, Pailin & Co., 1,275; Switchgear & Cowans, £1,275 3s.; Westinghouse Co., £1,324 17s. The tender of Ferguson, Pailin & Co. is recommended for acceptance. This tender is the only one which does not conform to the model conditions of contract of the Institution of Electrical Engineers. The Highways Committee reports that it has been in communication with the B.E.A.M.A. for some time as to certain conditions of contract put forward by that Association,

and states that before such conditions can be accepted several substantial alterations in the Council's Standing Orders will have to be made, and, quite apart from the consideration of the principle involved, the procedure to effect these alterations will occupy considerable time.

The Edison & Swan United Electric Light Co. has received a twelve months' contract for the supply of Royal Ediswan lamps to the Cunard Steamship Co.

United Water Softeners, Ltd., have received, among recent contracts, orders from the Admiralty, Vickers, Ltd., Armstrong, Whitworth Co., Brunner, Mond & Co., Daily Chronicle Paper Mills, Erith Oil Works. Since the outbreak of war the firm has entered into contracts for erecting over 100 installations for dealing with several millions of gallons of water daily.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £61 to £61 10s. (last week, £61 10s. to £62).

**Christmas Holidays.**—The ordinary business of the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), will be suspended on Friday and Saturday, January 1st and 2nd, on account of the annual stocktaking. The trade counter only will remain open to deal with urgent inquiries and orders.

## LOCAL NOTES

**London: Bethnal Green: Loan Periods.**—The bulk supply to be taken from the Stepney Borough Council referred to in our "Tenders Invited" column provides for current being supplied at a pressure of 6,000 volts through duplicate cables to two sub-stations, one in the western part of the borough and one in the eastern. In connection with the loan now proposed, the Finance Committee of the L.C.C. draws attention to the suggestion of the Council that a period of forty years should be allowed for the repayment of the loan for mains and twenty-five years for sub-stations with all the plant, but points out that until the general system of trunk mains to be laid throughout London has been settled, any departure from the period of twenty-five years for mains at present allowed should not be made. A period of only fifteen years is recommended for sub-station plant, and thirty years for the buildings.

**Hampstead: Preferential Charging.**—The Council has decided to contribute £10 towards the fund which is being formed by the I.M.E.A. for fighting the Ilford case, and has also authorised the Engineer and Manager to give evidence if desired.

**The L.C.C. Power Scheme.**—The Council supports a number of other borough councils in regretting that the L.C.C. has not yet seen its way to withdraw its electric supply Bill for next session.

**St. Pancras: Loan Periods.**—In our issue for Oct. 8th, p. 537, we referred to a proposal by the London County Council that the St. Pancras Council should agree to reduce the outstanding periods of the 42 years' loans on their machinery and plant, and that the Council was unable to see its way to agree to the suggestion. Since then a meeting has been held of representatives of the Finance Committee of the Council and the Loans and Estimates Sub-Committee of the L.C.C., with the result that it is now believed to be very unlikely that the matter will be further pressed by the County Council.

**Portsmouth: Death from Electric Shock.**—One of the electrical engineers at the Corporation's electric power station, Mr. F. W. Hepworth, was found in the station last week dead from electric shock. Subsequent examination showed that the deceased must have caught hold of a bare flexible lead for a rectifier apparently under the impression that the main switch was off. He had received a shock of 3,000 volts.

## SUMMARY

14,000 of the Berlin A.E.G. Co.'s employees, including two hundred officers, left to serve in the German forces. Up to the beginning of December 157 had been reported killed (p. 655).

We give details of the two Bills which deal with the supply of electricity in London. One is by the L.C.C. and the other by a combination of ten of the existing London electric supply companies. Both Bills deal with an area larger than that of the County of London, but the area proposed by the L.C.C. is by far the larger (p. 656).

THE new standardisation rules of the American Institute of Electrical Engineers contains a system of rating of electrical machinery based on maximum temperature, and not temperature rise above that of the atmosphere (p. 657).

A PAPER by Mr. F. Broadbent read before the Association of Engineers-in-Charge deals with the applications of electricity in the printing trade (p. 657).

A NUMBER of books on various branches of electrical engineering are reviewed on pp. 658 and 659.

A PAPER by Mr. J. F. Crowley read recently in Halifax reviews the conditions and advantages of electric driving in the woollen trade (p. 659).

A WAY of distinguishing between live and dead cables in a trench is described in our Questions and Answers columns (p. 660).

AN interesting Paper by Mr. H. Scholey, read at the Sales Managers' Association this month, dealt with the position of the electrical industry (p. 660).

WE publish some official statistics with regard to the wireless stations of the world (p. 661).

AMONG the subjects of specifications published at the Patent Office last Thursday are field telephone cable-laying reels, wireless telegraphy, feeder protection, and the starting of rotary converters. A patent for an electrostatic ore separator expires this week after a full life of fourteen years (p. 661).

WE describe an interesting system of electric heating with automatic temperature control and an electric water-heating system employed at the tramway offices in Glasgow (p. 662).

OTHER articles in our Trade Section deal with an instrument for measuring vibration, a shade suitable for reduced street lighting, the coupling-up of ironclad switches on the unit system, and the life of half-watt lamps. Some particulars are also given of German electrical trade with Russia (pp. 662 and 663).

A DIESEL engine set is required at Llandudno; three-phase induction motors at Shanghai; cables at Cleethorpes; and extensions are contemplated at Salford (£22,910), and Stockport (£17,000) (p. 665).

SOME figures are given of the increase in the demand upon the Manchester electricity undertaking since the war.—The discussion as to the management of the Belfast Electricity Department, which has arisen over a very small point, still continues.—A very completely-equipped electrical showroom has been opened at Burton-on-Trent (p. 666).

MAINLY owing to the war, the Silvertown Co. shows a loss of nearly £19,000 for the year to September 22nd (p. 666).

**The A.E.G. and the War.**—It appears from reports of the general meeting of the Allgemeine Elektrizitäts Gesellschaft that 14,000 of the company's employees were mobilised for the war, including 200 officers. Up to the beginning of December 157 had been killed. The company has contributed 500,000 marks per month in allowances to relatives of those at the Front and wounded. In addition to this there have been payments from the retiring pension and other charitable funds maintained by the company. The whole of the 89 employees of enemy nationality have left the firm's service. The total turnover for the business year 1913-14 was 453 million marks against 441 million for the previous year, which, however, included 95 million relating to trade with enemy countries. The latter figure for the year under review cannot be estimated, as accounts from the foreign branches have not come in owing to the war. The total hours of labour worked during the first four months of the year under review exceeded the figure for the corresponding months of the previous year in the proportion of 3 to 2.

**BINDING "ELECTRICAL ENGINEERING."**—Vol. X. of "Electrical Engineering" (Jan.—Dec. 1914) closes with our issue of to-day, Dec. 31st. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING CO., LTD., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

## THE FUTURE OF LONDON'S ELECTRICITY SUPPLY

WE have now had an opportunity of perusing the two Bills which are being promoted in the next session of Parliament to deal with the problem of the future of electricity supply in London. The most important, of course, is that deposited by the London County Council, the main features of which have already been indicated in our columns.

The Bill seeks to set up an Electricity Authority for London consisting of 27 members apportioned as set out in our issue of Dec. 17th, p. 639, and to transfer to this Authority all the powers of purchase at present possessed by the L.C.C. over the London companies' undertakings, and to give power to purchase local authority undertakings by agreement. In addition, the Authority will be endowed with the usual powers of an electric supply undertaking. The area of supply consists of the County of London, the County of Middlesex, portions of the Counties of Essex (including West Ham and East Ham), Hertford, Kent (including Gravesend, Beckenham, and Dartford), and Surrey (including Acton, Kingston-on-Thames, Wimbledon, Barnes, and Richmond).

Under the Bill the Electricity Authority is authorised to supply (a) authorised undertakers; (b) railways, tramways, canals, navigations, docks or waterworks; (c) to any person for any purpose within any portion of the area where there is not at present an authorised distributor, or where at the date of the passing of the Act a supply is not being given; (d) to any person within the area for any purpose with the consent of an authorised distributor. The authority will not be allowed to supply for lighting purposes except in bulk to authorised distributors, and also to the extent of 20 per cent. of any supply given for power purposes. Authorised undertakers will be required to enter into an agreement for seven years, and the maximum price which can be charged for supply under heading (b) is £3 10s. per kw. of maximum demand per annum, plus 0.25d. per unit. No maximum price for supplying authorised distributors in bulk is included in the Bill, but the authority must submit to the Board of Trade within a period of five years from the date of the transfer of any existing undertaking scale of maximum charges for each area so taken over.

Land is scheduled at Barking and Erith for generating stations.

Under Clause 65 of the Bill power is taken to transfer to an "Operating Company" the powers taken by the authority for giving supply and erecting generating stations. This transfer is to be for a period not exceeding 50 years, at the expiry of which the Electricity Authority resumes possession of the undertaking on repayment of the capital expenditure, less the amount paid to sinking or redemption funds. The Authority, which takes powers under another section of the Bill to spend up to £10,000,000 upon capital account, is authorised to advance money to the Operating Company for the purpose of taking over any undertaking, and also to the extent of two-thirds of any expenditure involved for other purposes. The power of the Authority to supply electricity, however, is to cease within five years of the passing of the Act unless an arrangement is made with an Operating Company during this period. In that event, the Electricity Authority would nevertheless be incorporated with the view of introducing uniformity into the supply of electricity in the area covered by the Bill.

Clause 77 of the Bill provides that where any authorised undertaker within the area of supply wishes to extend existing generating stations or erect new ones it must obtain the consent of the Electricity Authority, which consent is not to be unreasonably withheld. Again, any local authority applying for an electricity loan must give notice to the Electricity Authority, and no transfer of an existing undertaking can take place without the approval of the Authority. The Electricity Authority may also apply to the Board of Trade for a revision of the prices charged by any particular authorised undertaker.

Part VII. of the Bill authorises the establishment of the Technical Committee, the members of which are to be appointed by the Electricity Authority, who is to fix the remuneration to be paid.

The Electricity Authority takes full wiring, hiring, and fitting powers, as are at present possessed by all the London Borough Councils.

The second Bill relates principally to an amalgamation of most of the existing London supply companies, and an extension of their powers and areas.

It proposes to incorporate the London Electric Supply Co., with a capital of £6,000,000, of which £2,000,000 is to be 6 per cent. preference shares, to deal with the London electric supply problem on similar lines to those proposed in the L.C.C. Bill, but in a very much smaller area. This area consists of the County of London, the districts comprised in the Metropolitan Electric Supply Company's bulk supply area in Middlesex, a few districts in the rural district of Croydon (but not

including Croydon itself), Romford and Tilbury in Essex, and Penge in Kent. The first directors of the proposed company are: W. F. Fladgate, H. R. Beeton, E. Ironside Bax, W. R. Davies, Colonel R. E. Crompton, R. Stewart Bain, W. H. Cripps, A. E. Franklin, Walter Leaf, and J. Browne-Martin.

It is proposed that the new company shall compulsorily acquire the Charing Cross, Brompton and Kensington, Central Electric, Chelsea, Kensington and Knightsbridge, London Electric, Metropolitan, Notting Hill, St. James' and Pall Mall, and the Westminster companies. The names of the directors given above make it clear that all these companies are joint promoters of the Bill. The London companies not included are the City of London, County of London, South London and South Metropolitan Cos., and who may be expected to oppose the Bill, as their areas are attacked. No definite provision is made as to local authority undertakings, but these may be transferred by agreement.

The main object of the Bill is stated to be to unify the conditions of supply in the area scheduled, to give a supply in bulk to authorised distributors and to railways, tramways, canals, docks, or waterworks upon agreed terms. Agreements for seven years will be required.

In order to bring about the consolidation and uniformity of supply, the company must within three years of the passing of the Act submit to the Board of Trade a scheme for dealing with the whole area, having regard to the existing plant installed in any undertakings transferred or acquired by agreement. The Board of Trade is to inquire into any proposal of an authorised distributor to extend existing plant, and may refuse such extension if it considers that supply in bulk from the new company is a more economical proposition.

The company is entitled, after setting aside a 4 per cent. sinking fund on a 50 years' basis, to pay an 8 per cent. dividend upon the ordinary shares, and to pay any excess into a fund, which, when it exceeds an amount equal to 4 per cent. upon the ordinary shares, is to be used as to three-fourths in giving consumers a rebate on the amount paid by them for the preceding year, the remaining one-fourth being distributable among the ordinary shareholders.

The undertaking of the company is to be transferred to the London County Council or any other authority constituted for the purpose at the end of 50 years on payment of the nominal value of the capital unredeemed, and the payment by such an authority of all the liabilities on capital account.

The above is the third Bill referred to in our issue of Nov. 26th, and is evidently mainly based on the assumption that the L.C.C. scheme will be dropped or thrown out. A clause, however, provides for the contingency of the L.C.C. scheme being passed, and enables the Company to act as the "Operating Company" referred to in the L.C.C. Bill. The second Bill mentioned by us on Nov. 26th, which was for the sole purpose of giving these powers, has been dropped.

**Magnetic Tests of Iron with Alternating Currents.**—In a Paper read before the Scottish Local Section of the Institution of Electrical Engineers recently, Mr. J. S. Nicholson dealt with the difficulty that is experienced when testing iron stampings at high flux densities up to 20,000 lines per sq. cm. in ensuring that the electromotive force in the windings of the tester should be of true sine wave form. He showed that the divergence was mainly due to the presence of higher harmonics in the magnetising current, and described a method of compensating for this by providing by separate windings the necessary neutralising E.M.F.'s of higher frequency either by a short-circuited mesh winding, introducing a triple-frequency harmonic or by a separate alternator, with suitable instruments for revealing the correctness of the conditions. Certain correction factors were gone into, and the Paper presented an interesting account of a painstaking research.

**The Remuneration of Electrical Engineers.**—In the course of some remarks at a meeting of the Birmingham Local Section of the Institution of Electrical Engineers, Sir John Snell said that he felt that the salaries paid to junior engineers were inadequate, and that—after not only a good practical training but also a good college, and possibly also a university training involving years of work and much expense—engineers had a right to expect higher remuneration, and not some paltry sum of 25s. a week. He hoped that by attention to this matter the Institution might be successful in bringing about an improvement in this respect. Electrical engineering involving, as it did, a prolonged and scientific training, was as much a learned profession as that of the law, and he asked for the co-operation of all the members to bring about a proper recognition of the status of electrical engineers.

**"La Lumière Electrique."**—This fortnightly journal, the publication of which has been suspended since the beginning of August, owing to the mobilisation of the editorial staff, will resume publication to-morrow.

## AMERICAN RATING OF ELECTRICAL MACHINERY

THE new standardisation rules of the American Institute of Electrical Engineers, which took effect on Dec. 1st last, are voluminous in their completeness, and much in them will be agreed with as satisfactory and in accordance with the best interests of the electrical industry. There are, however, one or two points especially in connection with the rating of electrical machinery by temperature which we should like to comment on.

Looking back on the development of the subject in previous codes of rules, it will be remembered that the original German rules specified simply a limiting temperature rise above that of the atmosphere for an air temperature not exceeding 35° C., and that these figures (ranging from 50° C. to 80° C. for different classes of insulation) were somewhat higher than the ordinary 70° F. (21° C.) which was the prevailing British practice at the time. Certain definite percentage short-period overloads were also standardised. The newest German rules retained the same temperature rises, but sought to make the matter more definite by adding maximum temperature not to be exceeded even on overloads. This fixing of the maximum temperature was embodied in a more definite form in the rules of the International Electrotechnical Commission at its Berlin Conference, and the definition of overload was then altered in a way which virtually abolished temporary overloads and substituted a maximum rating dependent on the limiting temperature, whatever the temperature of the surrounding air. It is this system that has been adopted in the American rules.

The introductory clause on heating and temperature says that the capacity of electrical machinery "is usually limited by the maximum temperature at which the materials in the machine may be operated for long periods without deterioration. . . . The result of operating at temperatures in excess of the safe limit is to shorten the life of the insulating material." The way in which the limiting temperature is regarded as a definite point above which damage may be done, and below which the insulation will not suffer is seen in the next paragraph, which begins:—"There does not appear to be any advantage in operating at lower temperature than the safe limit as far as the insulation is concerned." We know of tests of insulating material heated for long periods at various temperatures which do not bear out this view. It is insisted strongly that "the actual temperature attained . . . and not the rise in temperature, affects the life of the insulation"; but we question whether the effect on a machine heated through a considerable rise from a low air temperature is the same as on a machine in a hot atmosphere heated comparatively few degrees, and those with a much less temperature gradient between the hottest spot and the surrounding air.

The maximum permissible "hottest spot" temperatures are given as 95° C. for (A1) "cotton, silk, and other fibrous materials not so treated as to increase the thermal limit"; 105° C. for (A2) similar materials treated or impregnated and including enamelled wire; and 125° C. for (B) mica, asbestos, and other materials capable of resisting high temperatures in which any Class A material or binder, if used, is for structural purposes only, and may be destroyed without impairing the insulation or mechanical qualities. The limits of temperature rise permitted under rated load conditions are found by subtracting 40° C. from these figures, and these are given in the second column of the table in the rules. "Whatever be the ambient temperature," continues the rule, "at the time of the test, the rise of temperature observed must never exceed the limits in column 2 of the table." This relates to test conditions, but it would appear that the purchaser may load his machine up to the maximum temperature, whatever the air temperature, and thus obtain a larger output when the weather is cold. This is regarded as an advantage in some comments in the *Electrical World* (New York), but we do not think it would be appreciated by all contractors during the maintenance period. A correction of 15° C. is to be made in arriving at the true "hottest spot" temperature from thermometer readings, so that the limiting temperatures by thermometer become 80°, 90°, and 110° C. respectively. Other corrections are given for resistance and thermo-couple observations.

The maximum temperature allowed on commutators is considerably higher than has hitherto been permitted in any rules, being 130° C. for currents of 200 amperes per brush arm, with 5° C. less for each additional 100 amperes per brush arm up to 900 amperes, for which current and over, 95° C. is the figure. These lower values for the larger sizes form a slight concession to the difficulties due to expansion

of the segments, but the main trouble will be to obtain satisfactory brush material to work at these temperatures, and to avoid expansion effects in the fit of the brushes in the holders. It is also specified that no part of the machine subject to handling shall have a temperature exceeding 100° C., except for a very short time. We should not like to lay hold of brush rocker handles at such temperatures even for a very short time.

## ELECTRICITY IN THE PRINTING OFFICE

A PAPER on this subject by Mr. F. Broadbent was read before the Association of Engineers-in-Charge on Dec. 9th. The author first reviewed the question of lighting at some length, favouring the provision of a moderate degree of general illumination amounting to not more than half that required on the working surfaces by high candle-power metal-filament lamps placed high up, and supplementing this by means of screened localised lamps immediately over the work. It was important not to go to either extreme in illumination. Small print, he said, was indistinguishable at 0.1 to 0.2 foot-candles, most easily deciphered with an illumination of 2 to 4 foot-candles, but was again indistinct at 8 to 10 foot-candles. Among miscellaneous applications of electricity in printing works was the production of electrotypes and the nickel-plating of stereo and other plates by electro-deposition. Electrical apparatus was also used to neutralise the static charge given to the paper in some fast-speed printing machines. The most important application was the electrical driving of the machines, which, owing to the nature of the work, was not only far more economical than mechanical driving, but produced better work and increased the output per machine. He was greatly in favour of individual drive for even the smallest machines, on the grounds of economy, convenience, and cleanliness due to absence of shafting and belts, and independent speed control.

Turning to the driving of actual printing machines, he showed typical power curves of Wharfedale and other patterns of flat-bed machines. These were best driven by compound-wound interpole variable speed motors, fastened to the actual frame of the machine, through suitable belts or gearing. The ordinary hand form of starter could give good results in exceptionally careful hands, but push-button control was generally preferable, both for presses of this kind and many of the miscellaneous machines used in the foundry.

In city newspaper work, where time is one of the principal objects, electricity plays an extremely important part, and is employed in practically every process from the delivery of the news by telegraph or telephone to delivery of the finished paper in the street. In a large rotary press there are hundreds of moving parts, amounting in the aggregate to tons of moving machinery which must be started gently and run at a very slow rate to permit of the paper strip or web being threaded between the rollers. Very smooth and gradual acceleration is necessary also to prevent breakage of the web. When once fairly started the machinery must be quickly run up to speed, without jerk or jar of any kind, until the machine is travelling at a rate sufficient to turn out from each deck from 24,000 to 34,000 copies of the paper per hour. Arrangements must also be made to couple the different decks or sections of the machine together, so that they shall start up and accelerate simultaneously from any one of the many push-button control stations located at different points on the press.

Except in very small sizes, rotary presses cannot be satisfactorily driven by the ordinary methods adopted for driving other kinds of machinery. The two principal systems are single motor drive with diverter control for the slow speeds and the double motor system. In the former a very heavily compounded motor is generally used. To start up, current is supplied through a resistance, which is gradually cut out until the motor starts. As soon as it has acquired, say, 5 per cent. of its full speed, the voltage across the armatures excites an automatic switch which connects the diverter resistance across the armature terminals. In this condition the armature cannot accelerate, as any tendency to do so would increase its back E.M.F. and divert more current into the diverter resistance. The next movement of the controller gradually increases the diverter resistance, the speed increasing until creeping speeds are passed, when the diverter circuit is broken and the machine runs as a plain compound-wound motor with armature resistance in circuit. The armature resistance is then gradually cut out, and after that the compound winding is cut out or diverted, the motor then running as a plain shunt motor. Further increases of speed are obtained by plain shunt regulation.

In the two-motor system a small auxiliary motor is geared

by a worm gear to the main, and takes the drive at the lowest speeds, and a free-wheel or self-releasing clutch is provided to permit the large motor to overrun the small one when the higher speeds are reached. The control of both motors is done by one controller, which is usually actuated by electromagnetic means by push-buttons about the machine. In the Ward-Leonard system a variable voltage is applied to the main motor from a motor-generator regulated entirely by field control. The "M. E." system depends on an electromagnetic slipping clutch, and the Mascord system employs a mechanical reducing gear, put in and out of action by a magnetic clutch.

## REVIEWS OF BOOKS

*We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.*

**Telegraphy.** By the late Sir W. H. Preece, K.C.B., F.R.S., and Sir J. Sivewright, K.C.M.G. Revised and partly re-written by W. L. Preece. 422 pp. 8½ in. by 5½ in. 269 figures. (London: Longmans, Green & Co.) 7s. 6d. net; abroad, 8s. 2d.

Our old friend "Preece and Sivewright," which was first published nearly forty years ago, and ran through many succeeding editions, was long the standard work to which one always turned when in search of information on matters telegraphic, and many will welcome the present revised and enlarged form which has been produced by Mr. Llewellyn Preece. The work was always intended to be addressed to the student rather than to the trained engineer, but in the early days the most advanced methods of telegraphy were such as to be easily intelligible to the student, and incidentally the book was a pretty complete treatise of telegraphy as then practised. Now, however, things are different, the growth of traffic has rendered more complicated methods necessary, of which the intricacies cannot be detailed in an elementary text-book. The earlier, simpler methods, however, are still largely practised in the more sparsely populated districts of the Colonies, India, &c., and the book, although not pretending to contain an advanced description of the most modern requirements, should prove of considerable use to a large class. Even in the increased size of volume adopted it has not been found possible to find room for a treatment of all the directions of modern developments, and the reviser reluctantly decided to omit the very large subject of submarine telegraphy, and confine the main portion of the book to land telegraph work. There is, however, a short chapter on telephony—an admirable condensed sketch of up-to-date practice—and another on wireless telegraphy equally suggestive and free from redundant matter.

As is naturally the case, the book has had to be very largely re-written, and to do this while living up to the reputation of the earlier work was a task that required courage to attempt. That Mr. Preece has worthily carried on his father's work in this respect will, we think, be the verdict of the many who will have occasion to study the result of his labours.

**The Elements of Electricity.** By W. Robinson. 596 pp. 9½ in. by 6 in. 374 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 10s. 6d. net; abroad, 11s. 6d.

This volume is by a professor of chemistry in the United States Military Academy at West Point, and has been prepared primarily for the use of American military cadets; but its arrangement is such as to make it useful to anyone desiring a general knowledge of electrical phenomena. After a brief introduction, the traditional, but not to everyone's mind the best, order of things is observed, and electro-statics is dealt with at some length, but without much mathematical theory, in eleven chapters. Following these the author treats of magnetism as far as is convenient considering that the student knows as yet nothing of electric currents. In the next chapters, however, he learns of the production of current from batteries, primary and secondary, but it is not till nearly the middle of the book that he is introduced to Ohm's law, although his ideas on electro-chemistry are getting advanced. Up to this point the treatment is a little long-winded, but in the next part, entitled, "Electro-magnetics," is somewhat speeded up. It connects up the ideas already acquired, and in this section are discussed heating effects, welding, arcs, furnaces, incandescent and other electric lamps, thermopiles and electrical units, while dynamos, motors, alternating

current, &c., are treated in the fifth part, entitled "Electro-mechanics." By this time the author is evidently short of space, and in a very brief but suggestive final portion on "High Potential," he treats rapidly of discharge of electricity through gases, electrical oscillations, and wireless telegraphy. The student will derive much knowledge from a perusal of this work, which in many ways is original, sound, and well written, even if it is a little unsatisfactory, as an instrument of education, in the sequence of the subject-matter, and its sense of proportion between the academic and the practical, the ancient and the modern.

**Laboratory Manual. Direct and Alternating Current.** By C. E. Clewell. 100 pp. 9½ in. by 6 in. 27 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 4s. 6d. net; abroad, 4s. 10d.

Thirty experiments are given in connection with D.C. and A.C. circuits, apparatus, and machinery. They have been chosen for the use of students in courses, other than electrical engineering, who take a brief amount of work in the fundamental principles of electricity. After the purpose of the experiment is stated, there is an exposition of the theory underlying it, then follow instructions for carrying out the work, with diagrams of connections, and then suggestions for making out the written report. The experiments are well chosen, having regard to the class of student for whom they are arranged, as they are all of a practical nature and are carried out in commercial types of apparatus. Each has direct bearing on articles in the text-book—"Elements of Electricity," by W. H. Timbie—and a list of these articles is given at the beginning of the description of each experiment. Provided, however, that a laboratory is properly staffed, it is doubtful whether the use of such a manual is advantageous to the students, as it may tend to make the carrying out of the tests more mechanical than should be encouraged.

**Continuous- and Alternating-Current Machinery.** By J. H. Morecroft. 466 pp. 7½ in. by 5½ in. 288 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 7s. 6d. net; abroad, 8s. 1d.

The author, who is Assistant-Professor of Electrical Engineering at Columbia University, has handled his subject in a very lucid manner. The book commences with a chapter on elementary principles of direct currents, and the reader is then made acquainted with the essential parts of dynamo-electric machinery, and then the principles underlying their operation. The treatment is thoroughly up-to-date, and several interesting charts and tables which materially aid the student are given. A chapter on efficiency concludes this part of the book. The principles of alternating currents are next dealt with, graphical methods being used to illustrate the reasoning wherever possible. This will probably be welcomed by the majority of readers in preference to the more rigid mathematical proofs which had to be mastered in the earlier books. The general construction of A.C. machinery, including alternators, transformers, and various types of motors and converters, is described in the succeeding 200 pages, which also contain a clear description of the Tirrill regulator. The last three chapters deal with polyphase power, auxiliary apparatus, and operation and care of electrical machinery, and will be particularly appreciated by those whose duties are connected with the generation of electric power.

**The Pocket-Book of Illumination.** By J. Eck. 85 pp. 6½ in. by 4½ in. 32 figures. (London: S. Rentell & Co., Ltd.) 1s. net; by post, 1s. 2d.

Mr. Eck has given us a useful little manual on illumination, dealing with the subject clearly and practically, without going into theory or mathematics. He emphasises particularly the claims of indirect lighting, giving attention principally to the use of arc lamps for this form of illumination, and many striking examples of this method, as well as of direct and indirect lighting by incandescent lamps, are illustrated. Tables are included from which the illumination produced by various arrangements of lamps can be ascertained, which will be useful in settling the spacing to be adopted in planning installations. The work relates principally to the illumination of industrial premises, and does not deal to any great extent either with private house or street lighting.

**X-Rays: An Introduction to the Study of Röntgen Rays.** By G. W. C. Kaye. 252 pp. 8½ in. by 5½ in. 97 figures. (London: Longmans, Green & Co.) 5s. net; abroad, 5s. 6d.

The name of the author, who is now head of the Radium Department of the National Physical Laboratory, is a guaran-

tee of excellence in the treatment of the subject, and the value of the book lies particularly in its descriptions of modern practical methods and apparatus, such as are used in medical work. The scientific side has, however, been by no means neglected, and an admirable sketch of the progress from Röntgen's original discovery in 1895 down to the end of last year. A great deal of valuable material has been brought together from scattered sources, and in addition to the historic and practical treatment to which we have already referred, there are most interesting chapters on other properties of Röntgen rays and theories as to their nature.

**Electric Traction.** By L. Calisch. 116 pp. 8 in. by 5½ in. 36 figures. (London: Locomotive Publishing Co., Ltd.) 2s. net; by post, 2s. 3d.

We have in this little book a reprint of a series of articles on electric traction on railways which appeared in the *Great Eastern Railway Magazine*. The author handles the subject with ability and clearness, and gives a very readable sketch of the present position of electric traction as applied to ordinary railways. He explains in what circumstances it can best compete with steam, describes the main features of the direct current, single-phase, and three-phase systems, and gives specially interesting chapters on electric locomotives and multiple unit control. These technical parts of the book are well illustrated with examples of modern practice; and last but not least in importance is a discussion of the economic side of the question, with a collection of actual costs of working.

**Drawing for Electrical Engineers.** By G. W. Worrall. 92 pp. 8½ in. by 5½ in. 70 figures. (London: G. Routledge & Sons, Ltd.) 2s. net; by post, 2s. 3d.

This work, which is one of the "Broadway" series of textbooks of technology, does not, as its title might be thought to imply, deal with the technique of draughtsmanship, but is really a practical handbook of mechanical design of dynamos and motors. It deals seriatim with bearings, shafts, rotors and stators of induction motors, D.C. armatures, commutators and magnet frames, brush gear and slip-rings. A very large number of dimensioned drawings of machine details appear, all taken from typical modern practice, and valuable quantitative data, as well as generalisations of principles, are contained in the text.

**Principles and Practice of Electrical Engineering.** By A. Gray. 391 pp. 9½ in. by 6½ in. 449 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

This work is based on a lecture and laboratory course to senior students at McGill University, but can neither be classed as an elementary nor as an advanced book. It does not go deeply into mathematical nor theoretical considerations, but the general principles are illustrated throughout by the most up-to-date applications, and the work is, perhaps, more a manual of practice than principles. The laboratory course occupies a short section at the end, and is scarcely on a level with the rest of the book. A wonderful deal of information is included spreading over a considerable range of electrical engineering matters, including alternating-current working and electric traction.

**Elementary Magnetism and Electricity.** By C. M. Gansky. 212 pp. 9½ in. by 6½ in. 121 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 6s. 3d. net.

This book differs somewhat from the ordinary book of its class in that it contains a number of illustrations, together with appropriate descriptions, showing the practical applications of the subject. Throughout the book, simple laboratory experiments are used as a framework, on which the theory is built up. The examples are rather few in number, and in every case the solution is given immediately below the question. If in some cases the student had been asked to solve the problems himself, he would probably get a more thorough grasp of the subject. In the first four chapters the author treats of magnetism and electromagnetism. The remaining six chapters of the book are devoted to the various applications of current electricity. Of these, the chapter on electrolysis contains an amount of information in a compact form, and a special chapter dealing with the theory of the dynamo and motor gives a clear conception of the basic principles upon which they depend. The recapitulations given at the end of each chapter are a decided addition to the value of the book, which is calculated to meet the needs of anyone who, whilst knowing something of the practical applications of electricity, feels himself to be lacking in a sound knowledge of first principles.

## ELECTRICAL DRIVING IN THE WOOLLEN TRADE

A LECTURE on this subject was given by Mr. J. F. Crowley before the Halifax Textile Society on December 3rd. The woollen trade, he said, has the following peculiarities from the driving point of view:—Small total horsepower required for each factory as compared with, for instance, the jute trade or the cotton trade; particularly poor load-factors, that is, a small percentage of the machinery running at a given instant; a varying trade, which may mean the shutting-down of a number of machines for long periods, or, again, the running of machines at night when trade is brisk. Electrical driving was able to show to great advantage in such circumstances. In comparing group and individual driving, the lecturer said that the simplest method of all was to replace the main engine by a single motor, but it was soon realised that advantage was obtained by dividing the shafting into groups, each driven by its own motor, and the advantages are greater still where the driven units are smaller and when still shorter lengths of shafting are taken. The shafting speeds in woollen factories were usually about 90 r.p.m., and some sort of speed-reduction gear was necessary between the motor and the shaft. Individual driving entailed higher capital cost, but brought advantages of saving in power and increase in production. The transmission losses, which are avoided by individual drive, are very much greater than is commonly supposed, for the increase in friction losses when shafting is loaded up is usually treated as negligible, although it is frequently very large; these additional losses in one test were shown to amount to 91 per cent. of the total light load losses, and in another to as much as 174 per cent. In estimating the saving in power with individual drive, account must be taken of the load-factor, since with individual motors the power-consumption for each machine ceases when the machine stops, while with group driving the whole of the shafting and belting must be run while a single machine is required. If  $N$ =the load-factor of the mill,  $I$ =the power lost with individual drive, and  $G$ =the power lost with group drive, then for these losses to be equal  $\frac{I \times N}{G \times 100}$  must equal 1. If

this formula gives a result greater than 1, then individual driving is at a disadvantage from a transmission loss point of view, while if the result is less than 1, the advantage lies with individual driving. In no case that the lecturer is aware of have individual loom drives with high efficiency motors shown to disadvantage. A weaving shed in Lancashire has a weaving efficiency of 77 per cent. to 80 per cent. for ordinary looms, and approaching 95 per cent. for automatic looms. In the woollen trade, however, 60 per cent. would be an average figure, and it would probably be correct to say that only a high-class shed would reach 66 per cent. The lecturer then passed on to the advantages conferred by the steadiness of the electric drive, which not only results in enabling the speed of the loom to be increased, but reduced stoppages due to breakages of warp and weft, and allowed of much quicker starting after a stoppage. Increases in production of from 10 to 25 per cent. have been recorded.

With regard to the driving of mules, it was sometimes advised that as many mules as possible should be driven by one motor, in view of the great variation in the load, to damp out the speed variations, but the lecturer contended that individual drive was much to be preferred. The really vital point, he said, is that with individual drive the variations in speed that occur simply ease the passage from one stage to another in the cycle of operations, while a constant speed is obtained during the actual spinning period when steadiness of speed is essential. With mechanical drive, on the other hand, or with group electrical drive, the peak loads of a certain group of mules may synchronise and produce a speed variation on the system of serious effect on the other mules, since it does not happen to synchronise with their operations. This point is of far greater moment than an improvement of a few per cent. in actual speed variation itself. Mr. Crowley also included a few remarks on the individual drive of centrifugals, and recommended small three-phase pole-changing motors arranged for regenerative braking.

**The Enemy's Trade.**—The Board of Trade has brought out a further list of articles with respect to which inquiries have been received from firms desirous of purchasing and of selling articles of which the sources of supply have been interfered with by the war. Firms can obtain these lists, and are invited to make inquiries from the Commercial Intelligence Branch, 73 Basinghall Street, E.C.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

#### QUESTION No. 1,423.

In each of two four-pole direct current generators, fitted with four interpoles and three slip-rings for connecting to a three-phase static balancer, the voltage on the two sides of the system differs by about 3 per cent. when the load is balanced (as current in the middle wire), and the brushes are in the neutral position. The series and commutating pole windings are connected one-half on each side of the armature, and the drop of volts across each set is the same. The voltage between each pair of slip-rings is equal.

Explain the cause of the unbalanced voltage, and suggest remedy.—KORL.

(Answers must be received not later than first post Thursday, Jan. 7th.)

#### ANSWERS TO No. 1,421.

In the old days the mistake was sometimes made of drawing more than one cable into the same duct. Is there any known method, short of cutting the cable, of finding out whether a concentric cable carrying alternating current, 2,000 volts, single-phase, is "alive" or "dead"?—R. McC.

An award of 10s. is given to V. F. Bush for the following reply:—

It is well known that there is an alternating magnetic field surrounding a live cable carrying alternating current, and this

FIG. 1.

FIG. 2.

fact is made use of, for our purpose, in the following manner. If a coil of insulated wire is brought in proximity with the cable the magnetic field induces a current in the insulated coil, which will produce a loud buzz or hum in a telephone receiver connected to the coil. Figs. 1 and 2 show diagrammatically the apparatus and method of use. A is an ordinary telephone receiver, and B a coil of, say, 10 layers of No. 28 S.W.G. double cotton-covered copper wire, wound for a distance of 3 ins. in the middle of a piece of soft iron 12 in. in length,  $\frac{1}{4}$  in. thick, and  $\frac{3}{4}$  in. wide, afterwards bent channel-shaped as shown in the sketch. In using the device it would be advisable to open out about two lengths of duct, say, 4 ft., and spread the cable as much as possible, to prevent appreciable interference from the stray flux of adjacent cables; or a sheet of soft iron could be held between the cables. There

will be no difficulty in distinguishing the live and dead cables; the telephone gives a very distinctive hum, which can be heard some distance from the telephone receiver. Before using, it would be advisable to test the apparatus with a battery to make sure that the circuit is not broken, as one cannot be too sure when working on H.T. cable.

No second award is made.

It may be mentioned that the inductive effect is to some considerable extent diminished by the two conductors of the cable being concentric, but in most cases a hum would be heard in the telephone. A triangular search coil of a much larger size than the coil illustrated would be more sensitive. As the cables are near together, it is possible that a hum in the telephone, although of less intensity, would be heard in the case of the dead cable also, especially as capacity or leakage currents through the lead sheaths would divide themselves among the various cables which are in external contact, and it is even not altogether impossible, in these circumstances, that the hum obtained from the dead cable might not be the faintest. The test should, therefore, be regarded rather as a guide than as an absolute indication of which is the live and which the dead cable; and the lead sheath and outer insulation should be removed by a rubber-gloved man, and the outer conductor tested to see if it is carrying current, before the cable is cut through.—Ed. E.E.

### NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Principles and Practice of Electrical Engineering," by A. Gray. 391 pp. 9 $\frac{1}{2}$  in. by 6 $\frac{1}{2}$  in. 449 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

"Mechanical World" Electrical Pocket-Book for 1915. 240 pp. 6 $\frac{1}{2}$  in. by 4 $\frac{1}{2}$  in. 130 figures. (Manchester: Emmott & Co., Ltd.) 6d. net; by post, 8d.

"American Handbook for Electrical Engineers." Edited by H. Pender. 2,023 pp. 7 $\frac{1}{2}$  in. by 4 $\frac{1}{2}$  in. 891 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 21s. net; abroad, 21s. 10d.

### THE POSITION OF THE BRITISH ELECTRICAL INDUSTRY

At a meeting of the Sales Managers' Association on Dec. 17th, Mr. H. Scholey, of Messrs. Scholey & Co., gave an address on the "Position of the British Electrical Industry and Methods of Extension in the Markets of the World." After reference to the unfortunate company promotions which followed the passing of the Electric Lighting Act of 1882, and the undoubted effect which these had upon the electrical industry in subsequent years, he dealt with the manufacturing side of the industry. The larger firms and manufacturers, he said, were able to compete in any part of the globe, but they were apt to be satisfied with a comparatively small enterprise, and did not

develop on a scale which would take them into the bigger and broader markets. An instance of this was the electric carbon industry. At the same time very few of these large manufacturers, whilst turning out a product second to none, had paid dividends for years on their ordinary capital due partly to the severity of competition from both home and abroad. There were other causes, however, and the chief of them was that the largest purchasers, being municipalities or great corporations such as railway companies, imposed conditions in their tenders which they were not able to impose upon the foreign manufacturer and frequently waived these conditions in accepting a foreign tender. The situation created by the war, however, gave the British electrical manufacturers their opportunity, but there would have to be co-operation and co-ordination among them if they were to take advantage of it.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

An official return from the International Telegraph Bureau at Berne states that on June 15th last there were in Europe 210 coast wireless stations and 2,947 ship stations (including 1,158 on warships). Of these Great Britain had fifty-four coast and 1,814 ship stations, Germany seventeen coast and 564 ship stations, and France nineteen coast and 812 ship stations. The Asiatic stations are given as forty-six coast (including sixteen in the Philippines and eleven in India) and 105 ship stations (ninety-eight, including sixty-five on warships, belonging to Japan). Africa had a total of fifty-four (including one ship), and the North and South American stations are given as totalling 241 on the coast and 918 on ships. This includes ninety-one coast and 689 ship stations in the United States,

and forty-seven coast and sixty-one ship stations in Canada. Australia and the Pacific account for thirty-six land stations and sixty-three ships, mostly belonging to Australia and New Zealand, and including nineteen Australian warships. It is interesting to note that the German Colonial stations are given as eight. The grand total, including both ship and shore installations is 4,620.

The Cayenne-Salinas cable of the French Cable Company was down on the 16th inst., and on the following day that between Singardja and Amperan was restored.—Code language is prohibited *via* Galveston to all places in Mexico excepting Vera Cruz.—The Indo-European Telegraph Company state that offices are open at Fao and Busreh in Turkish Asia for international traffic in plain language.—The cable between Madagascar and La Réunion has been repaired.—Owing to the severe storm of the 28th inst., delay was notified to all places in the provinces, Scotland, and Ireland, and telegraph companies were put to much inconvenience owing to the Irish lines being down, as well as the telephone system being generally disorganised and interrupted.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published Dec. 24th, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

20,806/13. **Wireless Telegraphy.** F. MILLER. Apparatus for generating electric waves, comprising two oscillatory circuits, one of which contains a spark-gap and is used as the primary, while the other is used as the antenna circuit. These circuits are disposed in such a way as not to influence each other directly they are attuned to each other. A third oscillatory circuit is coupled between them inductively or directly, but is not in tune with them, but has a natural period greater than either. (Two figures.)

26,447/13. **Field Telephone.** R. C. FREEMAN. A travelling cable reel for laying and taking up field telephone cables, in which the reel is rotated by the action of the road wheels. Provision is made for electrical connection between the reel and the cable and a portable telephone, and the return earth circuit is through one road wheel. The reel can be discarded without cutting the cable. (Three figures.)

29,984/13. **Feeder Protection.** B.T.-H. Co., J. WHITCHER, and E. B. WEDMORE. A protective system in which the feeder is composed of parallel connected sections, one surrounding the other. The relays and trips are arranged on a balance principle, the current in the two parts of the feeder normally balancing. Disconnection is effected when the current in the outer section predominates. The inner conductor may be of smaller section than the outer, and the balance relay may be set with a bias in favour of the inner conductor. (Two figures.)

4,359/14. **Starting Rotary Converters.** B.T.-H. Co. and F. P. WHITAKER. Starting is effected by an induction motor. At first the stator winding of the motor is connected in series with the armature of the converter. When the field has been built up, auxiliary reactances are placed in parallel with the stator winding of the motor, and finally, when synchronism is attained, both stator winding and reactance are short-circuited. (One figure.)

### Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.\*

Summaries of some of the more important of these Patents will appear in our next issue.

**Electrometallurgy and Electrochemistry:** SNYDER [Electric furnaces] 25,171/13; BOISSIER [Suspension of anodes] 11,610/14; COUTAGNE [Nitride furnaces] 12,057/14.

**Heating and Cooking:** PATE and WOOD [Heating apparatus] 12,605/14.

**Incandescent Lamps:** RHODES [Variable candle-power lamp] 24,871/13; PETTINGILL [Bulbs] 4,590/14.

**Batteries:** SIMMONS [Dry cells] 1,972/14.

**Switchgear, Fuses, and Fittings:** STATTER [Tripping devices] 28,111/13; HAYWOOD [Controllers] 28,292/13; AMBERTON [Control gear] 28,527/13; WESTERN ELECTRIC Co. (Woodward for W.E.

Co., U.S.A.) [Control apparatus] 1,154/14; BERETTA [Switches] 3,530/14; IGRANIC ELECTRIC Co. (Cutler Hammer Mnf. Co.) [Controlling devices] 3,650/14.

**Telephony and Telegraphy:** SARGENT [Telegraphy] 28,409/13; MARCONI'S WIRELESS TELEGRAPH Co. and ROUND [Wireless receivers] 28,413/13; MURRAY [Tape transmitter] 28,559/13, and [Driving of multiplex distributors] 3,436/14.

**Traction:** RENAULT [Car lighting dynamo control] 27,477/13.

**Miscellaneous:** A. G. BROWN, BOVERI ET CIE [Vapour rectifiers] 186/14; OLDFHAM [Locking apparatus for miners' lamps] 2,249/14; COLLINSON [Resistances] 7,677/14; MELLERSH-JACKSON (Interstate Electric Novelty Co., U.S.A.) [Battery lamps] 11,920/14; CAMPBELL [Electrically worked ash hoist] 15,224/14.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distribution:** APPAREILLAGE GARDY SOC. ANON. [Junction boxes] 23,571/14.

**Ignition:** JACOBSEN and anr., 21,510/14.

**Incandescent Lamps:** WESTINGHOUSE METALLFADEN GLUH-LAMPENFABRIK GES., 25,136/14.

**Instruments:** LINCOLN [Volt-ampere meters] 22,487/14.

**Storage Batteries:** JACOBSEN and anr. [Charging] 21,509/14.

**Telegraphy and Telephony:** OLSSON and anr. [Telephone repeaters] 22,937/14; DIXON [Telegraph systems] 23,380/14.

**Traction:** JACOBSEN and anr. [Starting and ignition systems] 21,512/14; RENAULT [Starting and car-lighting system] 23,444/14.

**Miscellaneous:** A.E.G. (Berlin) [Transformer connection for three-phase vapour rectifiers] 23,505/14.

### Opposition to Grant of Patent

29,059/13. **Sparkign Plugs.** C. SPADA. A grant has been allowed, in spite of opposition, on this specification, which describes sparking plugs with the head arranged so that it can be rotated to clean the points.

### Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

23,878/00. **Ore Separators.** L. I. BLAKE and L. N. MORSCHER. In these separators powdered materials of different conductivities are separated by passing in a stream through an electrostatic field.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Dynamos, Motors and Transformers:** A. MAGNUSON [Three-phase motor control] 18,125/05; M. MILCH [Variable speed induction motors] 20,743/09; C. B. WALKER [Quick action multiple contact switch] 20,786/09.

**Incandescent Lamps:** Z. ELECTRIC LAMP SYNDICATE (H. Zerning) [Metal filaments] 20,223/07.

**Switchgear, Fuses and Fittings:** M. STIPKOVITSCH [Signs] 19,037/08; R. S. WOODS [Electroliers] 19,183/08.

**Traction:** DRICK, KERR & Co., LTD. (Braun) [Magnetic track brake] 20,845/09.

**Miscellaneous:** OTIS ELEVATOR Co. (Otis El. Co., New York) [Automatic starter for lifts] 18,155/01.

\* It is announced that from to-morrow, the price of printed specifications will be 6d. each, including inland postage, instead of 8d. as at present.

## "ELECTRICAL ENGINEERING" TRADE SECTION

### AUTOMATIC ROOM AND WATER HEATERS

ON a recent visit to Glasgow we were shown, by Messrs. A. Schonfield & Co. (21 Hope Street), a pleasing design of electric stove, and also a thermostat device for maintaining room temperature constant and a water-heating arrangement on the same principle. These have been adopted by the Glasgow Corporation Tramways Department, who have 26 of the stoves in use at their offices (half of them

FIG. 1.—THE "HESTIA" STOVE.

with the patent thermostat), and also a water-heating installation supplying 10 to 15 basins in the lavatory.

Fig. 1 shows the general appearance of the stoves for the offices. They consist of an iron foot upon which rests a cylinder of ruby glass with lamps inside, and above this is a perforated metal top. Just inside the top is a removable annular trough, which is filled with water to keep the air moist. The dimensions of the stove are 22 in. high by 12 in. diameter, and the power taken is 3 kw. each in the largest

FIG. 2.—THE THERMOSTAT.

size. The heating element is a spiral of resistance wire wound on a spiral core of soft refractory material.

The thermostat and automatic switch used in connection with the stoves are shown in Figs. 2 and 3 respectively. The bi-metal strip of the thermostat (on the "Grundty" principle) is adjusted to hang straight at the temperature it is desired to maintain (60° F. in the case of the tramways offices), and deflects to one side or the other when this is

exceeded or diminished by  $\frac{1}{2}^{\circ}$ . It then pushes over a rocker, which actuates the automatic switch. The latter is of the mercury type. The main heater circuit is made in two mercury cups seen on the right. As soon as the switch goes over, current is cut off from the coil circuit by the action of a small amount of mercury, in the glass tube seen above the coils, which, when the tube is tipped, rolls away from two contacts at one end corresponding to the coil just put in action, and joins two corresponding contacts for the other coil at the other end. The tube is about 4 in. long and  $\frac{1}{2}$  in. diameter, and the contacts are of platinum; a special oil in the tube ensures a clean break. It is estimated that con-

FIG. 3.—THE AUTOMATIC SWITCH.

siderable saving in current will be effected by this means of regulation.

A similar thermostat (but, of course, set to a higher temperature) is used in connection with the hot water supply mentioned. A 20-gallon tank, which is well lagged, has a heating element at the bottom. Three heats corresponding to 17, 6, and 4 amperes at 250 volts are provided, controlled by a 3-way switch, but the thermostat will simply switch on or off in accordance with the temperature of the water. The thermostat is not actually in the water, but is enclosed in a tubular chamber, one end of which is fixed into the tank, and acquires its temperature by conduction from the metal.

### GERMAN ELECTRICAL TRADE IN RUSSIA

THE Board of Trade Journal publishes extracts from a Russian paper communicated by the British Consul-General at Moscow regarding the investment of German capital in the electrical industry in Russia. The group of closely united German electrical firms have established practically a monopoly in Russia, and the capital of these Russo-German companies is given as follows:—A.E.G., £1,270,000; Siemens & Halske, £530,000; Siemens-Schuckert, £1,585,000; United Cable Factories, £635,000; Polish Siemens Electrical Co., £105,000; "Volta" Share Company, £111,000. The report of the Russian A.E.G. for 1913 states that, "thanks to a whole series of orders from Government and private establishments, the activity of the company has been very considerably extended. The number of fulfilled orders exceeds by 25 per cent. the turn-over of the previous year, while the number of orders in hand exceeds the total turn-over for 1913." The reports of the other companies bear witness to similar successes. An illustration of the German methods of combination may be taken from a protocol of a general meeting of shareholders of the United Cable Factories, from which it appears that of a total of 19,200 shares (of 250 roubles each), 6,235 shares are held by Siemens & Halske, 6,120 shares by the Allgemeine Elektrizitäts Gesellschaft, and 6,120 shares by Felten & Guillaume. This same United Cable Factories also belongs, together with three other enterprises, to the so-called "Abnehmer Syndicate," a syndicate of consumers of copper, which in its turn has contract relations with the Russian copper syndicate "Mied." German capital is also directly interested in a whole series of electrical concerns in Finland, and in this connection it is interesting to note that the realisation of Finnish municipal loans in Germany generally included conditions whereby all municipal orders were to be given preferentially to German firms.

## THE FULLARTON VIBROMETER

AN ingenious instrument for measuring the vibration produced by generating sets or other machinery has been developed by Kelvin, Bottomley & Baird, Ltd., in the Fullarton vibrometer, which is illustrated here. The apparatus is purely mechanical in its action, and depends on the oscillation of a reed tuned to the frequency of the vibrations. The vibrometer is rigidly attached to the machine in question and vibrates with it. It is only 1½ lb. in weight complete, so its own inertia has a negligible effect. The reed is of flat metal clamped permanently at the lower end, and also provided with a sliding clamp, so that the length of the

THE FULLARTON VIBROMETER.

free portion can be varied to tune the reed. A millimeter scale enables the free length to be read off, and the amplitude of the vibration is observable on an adjustable horizontal scale. Provision is made for angular adjustment relatively to the clamping piece, and this takes a convenient spanner-shaped form. The reeds are carefully calibrated, and a set of various different thicknesses each with its calibration curve is supplied with each instrument. Very complete information as to the amplitude, frequency, and direction of vibrations can be obtained by an intelligent use of the instrument, which should be of considerable utility both in settling disputes and verifying quantitative guarantees.

## NEED REDUCED STREET LIGHTING BE SPOTTY?

CONSIDERABLE discussion has arisen recently with regard to the methods adopted for reducing street lighting in conformity with the requirements of the authorities, and Messrs. A. W. Beuttell, Ltd. (109 Victoria Street, S.W.), have sent us an interesting communication on the subject. They doubt whether the existing crude methods of painting

FIG. 1.

the lamp globe or surrounding it by a piece of sacking accomplishes the object sought, viz., reduction of illumination and at the same time giving an irregular and misleading disposition of the brightest units in the main and lesser thoroughfares. The result of obscuring a portion of the lamp globe is a spot of light of great intensity immediately in the vicinity

of the lamp-post, which must be observable from a considerable height. The result of these bright spots of light is also that the users of the thoroughfare emerge from a brightly illuminated space into one of comparative blackness, which itself is a source of considerable danger to fast-moving traffic and users of the roadway generally. They suggest, therefore, the adoption of a reflector which, whilst cutting off the upward rays, would give a minimum illumination over a maximum area, and have designed an aluminium reflector, whose general appearance is shown in Fig. 1. In actual practice the reflector is provided with a suitable opening at

FIG. 2.

the top so that it may be slipped over the existing lamp or lamps and adjusted in the correct relative position thereto. The performance of the reflector is shown from the characteristic light distribution curve given in Fig. 2, from which it will be noticed that it is of the "extra extensive" type with the maximum illumination at an angle of 30°. Messrs. A. W. Beuttell add that they will be pleased to co-operate with central station engineers with a view to adapting the reflector to their individual requirements.

## UNIT SYSTEM OF "SALFORD" SWITCHES

IN order to provide a neat and orderly method of arranging the switchgear when a number of motors are controlled from one point, as, for example, in the motor-room of a wet mill in a cement works, the General Electric Co., Ltd. (of Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), have developed an attachment which enables their well-known "Salford" switches to be connected up on the unit principle. The attachment consists of a cast-iron box containing horizontal copper bus-bars. These are so

"SALFORD" SWITCHES ARRANGED ON THE UNIT SYSTEM.

constructed that they can be connected up easily and solidly with the bus-bars of adjoining switches so as to form a solid run of bar throughout the whole length of the bank of switchgear. In this way any number of "Salford" switches of the same or different capacity can be connected or disconnected in a short space of time. The attachments are constructed so as to fit easily together, and the principle enables considerable economies to be effected in the cost of wiring up, and, in addition, greatly improves the reliability and appearance of the installation.

# BOOKS

We shall be pleased to send any of the following books to addresses in the United Kingdom at the prices named.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

- Electric Wiring. W. C. Clinton. 3rd ed. 2s. net; by post, 2s. 3d.  
 Electric Light Fitting. S. C. Batstone. 5s. net; by post, 5s. 4d.  
 Electric Circuit. Theory and Calculations. W. P. Maycock. 3s. 6d. net; by post, 3s. 10d.  
 Electric Wiring, Fittings, Switches, and Lamps: Circuits. W. P. Maycock. 6s. net; by post, 6s. 4d.  
 Mechanical World Electrical Pocket Book for 1915. Cloth, 6d. net; by post, 8d.

 Dynamo Lighting for Motor-cars. By M. A. Codd. 2s. 6d. net; by post, 2s. 10d.

Larger or more advanced books on many of the above subjects, and also on other branches, will be recommended on application.

ALL OTHERS BOW BEFORE  
**The CRYSELCO**  
 METAL FILAMENT LAMP.

**BINDING VOLUME X.**

OF

**"ELECTRICAL ENGINEERING"**

JANUARY to DECEMBER, 1914.

Subscribers' Numbers, sent to us Carriage Paid, will be bound in strong dark red Art Linen, with strengthened corners and back, and returned to any address in the United Kingdom, Carriage Paid, for 4s. 6d. Binding Cases only, 2s. each, or 2s. 4d. by post (Colonies and Abroad, 2s. 6d.) Volumes for the Colonies and Abroad will be sent Carriage Forward.

Index to Vol. X. Price 1d. (Post Free, 2d.). It will be supplied free of charge with binding cases and binding orders.

**THE KILOWATT PUBLISHING CO., Ltd.**  
 203-206, Temple Chambers  
 LONDON, E.C.

## LIFE OF HALF-WATT LAMPS

AN installation of Osram half-watt lamps in a large paper mill, carried out by the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.), comprised fourteen 110-volt 500-watt (1,000 c.p.) lamps. Only two of these lamps had a life of under approximately 1,200 hours, whilst ten were still in use after burning from 1,298 to 1,870 hours. The average life of the 14 lamps was as high as 1,505 hours, and the candle-power had not diminished appreciably since the lamps were installed. It is of interest to note that the lamps referred to were used under particularly unfavourable conditions, namely, in an extremely damp atmosphere where large temperature variations were experienced, and, moreover, they were subjected to considerable vibration. These figures bear out the fact that the estimate of an approximate life of 1,000 hours is a very conservative one, and in actual practice is greatly exceeded. Moreover, we are informed that this instance is but one of many, all equally satisfactory, and all users speak in glowing terms of the excellent qualities of the Osram half-watt lamp.

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**RADIATORS.**—A new catalogue of electric radiators, fires, and convectors of British manufacture, forming Part I. of their electric cooking and heating catalogue, is being issued by the Sun Electrical Co., Ltd. (118 & 120 Charing Cross Road, W.C.). The list is very comprehensive, and includes many types of luminous radiators, electric "fires," convectors, and factory type radiators. The Company will be pleased to send copies to any of our readers who are interested.

**INDUCTION MOTORS.**—A well-arranged list from Crompton & Co., Ltd. (Salisbury House, London Wall, E.C.), and Chelmsford, deals with protected-type induction motors for polyphase circuits in sizes ranging from 3 to about 200 h.p. with slip-ring or squirrel-cage rotors. Full particulars of outputs, efficiencies, &c., are given with dimensions, shifting specifications, &c., and prices of extras and spare parts. A leaflet from the same firm gives particulars of machines in stock ready for delivery.

**ELECTRICAL SUPPLIES.**—A leaflet from Donovan & Co. (47 Cornhill Street, Birmingham), printed in English, French, and Spanish, gives particulars of British-made continuous-current starters. Various other electrical accessories are dealt with in other cards and leaflets from the firm.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**LAMPS.**—Three or four very humorous postcards testifying to the strength, economy, and brilliance of Pope Elasta wire lamps are being circulated by Pope's Electric Lamp Co., Ltd. (Hythe Road, Willesden).

**ALUMINIUM.**—The British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), has issued a new and enlarged edition of the useful pocket book entitled "Aluminium: Facts and Figures." A good deal of additional matter appears, including data on bars, rods, overhead lines, circles, &c. The Company will be glad to send copies of this and other information as to the uses of aluminium to those interested.

## CALENDARS, &amp;c.

Our Editor has been very pleased to receive from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), the fine morocco leather-covered large sized blotting book which accompanies their cordial seasonable wishes.

The Sun Electric Co., Ltd., have shown a welcome optimism in sending to their customers a cleverly constructed combined bank-note case and purse with the kind hope that notwithstanding the present crisis it may prove useful. We understand that a few of these are still left, and the company will be pleased to send one to any of their friends so long as the supply lasts.

The calendar of Pope's Electric Lamp Co. (Hythe Road, Willesden) is of the lighthouse design so eminently suitable to be identified with their wares, and is most effective.

The Hart Accumulator Co., Ltd. (Marshgate Lane, Stratford, E.), have kindly sent us an office blotter combined with calendar of useful form.

A convenient letter-opener and rule from C. L. H. Blume (The White Building, Fitzalan Square, Sheffield) enunciates two good maxims: "Use this rule in your office, and 'Megomac' and 'Insulac' varnishes in your works."

The Electric Construction Co. (Wolverhampton) have kindly sent us one of their very neat little pocket leather-covered card-case diaries for 1915.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Cleethorpes.**—Cable extensions are required.

**Heckmondwike.**—A new economiser is required.

**Llandudno.**—The Electrical Engineer has prepared a scheme of extensions. A 220-kw. Diesel engine set is suggested.

**Salford.**—A L.G.B. inquiry is to be held concerning a loan of £22,910 for electrical extensions.

**Shanghai.**—Sixty-eight three-phase induction motors in various sizes between 5 and 60 B.H.P. with slide rails and liquid starters. Consulting Engineers, Preece, Cardew & Snell, 8 Queen Anne's Gate, S.W. Jan. 12th.

**Stockport.**—An L.G.B. inquiry is to be held concerning a loan of £17,000 for electrical extensions.

## Wiring

**Dublin.**—Metropolitan police barracks. Secretary. Jan. 8th.

**Edinburgh.**—New workshops, King's Stables Road. City Electrical Engineer, Dewar Place. January 6th.

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Birmingham.**—Extensions to West Heath Hospital. Architect, W. H. Ashford, 32 Paradise Street.—School at Hall Green.

**Coventry.**—New school.

**Ealing.**—Library (£4,600).

**Llanelli.**—Isolation hospital.

**Northwich.**—New post office. H.M. Office of Works, Storey's Gate, London, S.W.

**Portsmouth.**—Elementary school, Southsea.

**Preston.**—New baths, Saul Street.

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. A. Robertson, late Chief Electrical Engineer at Greenock (now at Salford), has been granted a honorarium of £200 by the former, in connection with his work upon the extension of supply to the Port Glasgow district.

Mr. A. Coveney, late Electrical Engineer and Tramway Manager at Erith, now in private work, has been presented with a gold Albert by the staff of the Erith Tramways and Electricity Department.

Particulars are given in our advertisement columns of a number of central station appointments.

Mr. A. C. Eborall's private address has changed from Lampton (Middlesex) to 45 Addison Road, W.

A foreman linesman is required at the Dickinson Street Works of the Manchester Corporation. (See advertisement on another page.)

An electrical engineer is required for Ceylon. (See advertisement on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £60 10s. to £61 (last week, £61 to £61 10s.).

**The Gremer Lamp & Engineering Co., Ltd.**—This Company announce their removal to larger premises at Moorfield Works, Whingate, Wortley, Leeds. Mr. C. Willan's connection with the Company has been severed, and another London representative will shortly be appointed. Meantime, all inquiries from the London district should be addressed to the Leeds works.

**Colonial Agencies.**—An Australian firm is desirous of representing United Kingdom manufacturers of electric cranes. Further particulars at Office of the High Commissioner for Australia, 72 Victoria Street, S.W.—A firm in Montreal wishes to get into touch with United Kingdom manufacturers of electric pocket-lamps and electrical advertising novelties. Further particulars at 73 Basinghall Street, E.C.

**W. A. Davis & Co.**—Mr. W. A. Davis informs us that he has terminated his agreement with the Adnil Electric Co., Ltd., and is now trading under the above style at 25 Victoria Street, S.W., as dealer in electrical supplies, making a speciality of pocket-lamp cases, refills, and bulbs.

**Russian Agency.**—An Englishman in Moscow desires to get into touch with United Kingdom manufacturers of electric lamps and fittings. Further particulars at 73 Basinghall Street, E.C.

**Liquidations.**—A first meeting of creditors of the Electro-Steel Foundries will be held at 33 Carey Street, London, W.C., at 11.30 a.m., on January 8th, 1915.

## LOCAL NOTES

**Belfast: Reorganisation of Electricity Department.**—Some time ago mysterious charges were made as regards the organisation of the Electricity Department. No details were published, but a sub-Committee was appointed and four separate reports, all of which have been rejected by the Electricity Committee, were presented. The matter has again been discussed by the Corporation in Committee, and a resolution has been passed in favour of a reorganisation of the department. It appears now that the trouble has arisen over the dismissal of three workmen by the Chief Electrical Engineer.

**Burton-on-Trent: Electricity Showrooms.**—The Electricity Department has just opened some new showrooms, which include a completely equipped dining-room and kitchen. In the latter, electric cooking apparatus is shown in actual use by a lady demonstrator.

**Manchester: Demand for Electricity.**—With the exception of the first fortnight in August, the output of current has shown regularly weekly increases of from 3 to 5 per cent. over the corresponding period last year, since the war began. The maximum demand was reached on Dec. 18th with the figure of 50,310 kw., compared with 49,897 kw. last winter. The department has to meet allowances to employees enlisted to the extent of £10,000 per annum, whilst the increase in the income tax on the profits of the undertaking

will amount to £4,600 this year. Nevertheless, it is intended to maintain the contribution to rates of £30,000.

**Rugby: Prepayment Meters.**—The Electric Lighting Committee is considering the adoption of prepayment meters.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**India Rubber, Gutta Percha, & Telegraph Works Co.**—There was a loss of £18,922 for the year to Sept. 22nd. This loss is attributed mainly to the diminution of sales in England due to the war and the entire stoppage of manufacturing in France from the same cause. The works at Persan have now been re-opened. By drawing on the reserve, a final dividend, making 5 per cent. for the year, is declared on the ordinary shares.

**Power Gas Corporation.**—At the annual meeting last week, Sir A. Mond, Bart., referred to an important contract for gas-driven generating plant which the Company has completed for a large Japanese scheme of railway electrification. The Japanese Government has now taken over the plant, which is at work.

**Brown, Boveri & Cie.**—The report of this Swiss firm states that the receipts for the last financial year were 9,594,395 francs (compared with 7,450,073 in the previous year), and the expenses 5,349,924 francs (compared with 4,513,676 in the previous year). After writing off 2,613,943 francs (compared with 1,511,118 in the previous year) it would have been possible to increase the dividend from 8 to 9 per cent., but in view of the new situation created by the war, only 5 per cent. is to be paid and 1,000,000 francs carried to a reserve against war losses. Last spring the capital of the company was raised from 28 to 32 million francs.

**Allgemeine Electricitäts Gesellschaft.**—See page 655.

**Mather & Platt, Ltd.**—Messrs. Mather & Platt, Ltd. (Park Works, Manchester), inform us that they have had a very satisfactory year's business. The Electrical Department has been exceedingly busy, especially in connection with the electrification of mines, collieries, and textile factories both at home and abroad. Many other industries have also seen the advantages of electrification, notably flour millers, and an installation has just been completed at a flour mill aggregating some 2,000 B.H.P. Large numbers of the firm's water filters, high-speed vertical duplex gas engines, and turbine pumps have also been supplied.

**International Engineering Congress, 1915.**—We have already referred to, and contradicted, a rumour that this Congress was to be abandoned. We have now been officially informed that the electrical section of it is definitely abandoned, but that the remainder of the Congress will proceed in accordance with the original programme.

**Royal Institution.**—A course of experimentally illustrated lectures on "Science in the Home," adapted to a juvenile auditory, will be given by Prof. C. V. Boys as follows: Jan. 5th, "Heat in the Home"; Jan. 7th, "Electricity in the Home"; and Jan. 9th, "Light in the Home."

**Private Companies.**—The second edition of a book entitled "Private Companies, their Utility and the Exemptions they Enjoy," by Mr. H. W. Jordan, has been published at the price of 6d. net by Jordan & Sons, Ltd. (116 and 117 Chancery Lane, W.C.), company registration agents. The advantages of forming businesses into private companies are explained, and a good deal of useful information as to those sections of company law which apply, and the procedure to be adopted both for the registration and carrying on of new private companies and their subsequent conversion into public companies, is given.

**Electro-Harmonic Society.**—A smoking concert will be held in the Holborn Restaurant (King's Hall) to-morrow (Friday) at 8 p.m.

**Meter Approved.**—The Board of Trade has approved the Electrical Apparatus Co.'s E.A.C. induction motor meter, type H.T., and the means for fixing same.

**Contraband of War.**—A new list of contraband articles, taking the place of previous lists, has been issued. The new list includes as absolute contraband, copper (unwrought and part wrought), copper wire, aluminium, rubber (including raw waste, and reclaimed rubber), goods made wholly of rubber, and tungsten.

### Why Cyclone Fans are Economical.

BECAUSE:-

1. They consume only a small amount of power—therefore the running cost is low;
2. The maximum amount of air moved per hour exceeds that of any other make; and
3. they run silently and are specially built for severe service.

## DON'T WASTE JUICE.

The light load losses of SMIT TRANSFORMERS are from 25 to 45 % less than those of other first class makes. An ordinary 120 k.v.a. transformer loses about 1,100 watts as magnetising current; an 120 k.v.a. SMIT TRANSFORMER loses only 655 watts. The difference represents a saving of about 3,500 units a year on each transformer. The full-load efficiency is as high as any, and the cost as low as any.

**BUY SMIT TRANSFORMERS.**

# THE A.C. BUZZER

(Patent No. 22394/13.)

Replaces both bell and battery, wherever alternating current is available. Supersedes our bell transformer and separate bell. It contains no working parts, gives a uniform sound, and is always perfectly reliable.

## A NEW GROUP OF SMALL D.C. INSTRUMENTS IN SWITCHBOARD, PORTABLE & BATTERY TESTING TYPES.

Model 280 Triple range Volt-Ammeter.

**T**HESE instruments are of the pivoted moving coil permanent magnet type, and have been designed to meet every requirement of D.C. measurement where small amounts of energy are involved.

The group comprises about 300 standard ranges, including Ammeters, Voltmeters, Mil-Ammeters, Milli-Voltmeters, and Volt-Ammeters. The Instruments are accurate, dead beat and reliable, and their construction throughout embodies those refinements of mechanical work and beauty of finish which are characteristic of all WESTON Instruments.

The sphere in which they may be usefully employed is wide, comprising general testing, small light and power plants, battery charging panels, ignition systems, battery testing and electric vehicles.

They are small enough to be conveniently carried in the pocket or to be held in the hand, and their weight ranges from 11 ozs. to 1 lb. Low price is a special feature of these Instruments, which are listed from 47/- upwards, subject.

WRITE FOR LIST D 3.
